

8. Correlation and variation of Normal Rainfall for July, August and September in North Bengal.—*By* P. C. MAHALANOBIS.

The daily, monthly (for the months of July, August and September) and tri-monthly (the above three months taken together) normals as well as tri-monthly variabilities (as given by the coefficient of variation) and a large number of correlations (between different months for the same station and also between different selected stations for the same month) have been recently calculated using all available data from 1870 to 1922. A general discussion of the statistical results is given in this paper.
