

41. On an improved model of the Profiloscope.

P. C. MAHALANOBIS, Calcutta.

A photographic profiloscope designed by the author was described in a previous communication to the Indian Science Congress in 1933 and 1936. The accuracy attained in profile measurements on photographs taken with this instrument was discussed in a paper published in *Sankhyā*, Vol. 3, Part 1 (March 1937).

Further improvement have been made to ensure greater accuracy in seating the subjects in the same standard position. The improved model and photographs taken with it will be exhibited.
