# DEDIAN STATISTICAL DISTITUTE Statistician's Diploma Examination - May 1964

Full marks + 100

Paper I: Official Statistics and Descriptive Statistics
(Theoretical)

Time 4 hours

a) Figures in the margin indicate full marks. b) Answer six . questions in all - not exceeding three from any group. o) Use of calculating machines is not permitted. Croup A Write a critical note on the present position of statistics of live-1.0) stock and livestock-products in India. Give the names of the publications containing these statistics. [10] That suggestions have you to offer for improving their reliability? **[6]** Give a detailed account of the nature and scope of 'civil aviation'. 2.a) statistics, available at present in India. What are the publications you will consult for obtaining these statistics? [10] Enumerate some of the important measures that you will adopt for ensuring comparability among statistics pertaining to different modes of transport. [6] 3. a) Describe the scope and coverage of the availatie foreign trade statistics of India. Also, suggest some possible improvements. [10] b) What statistical devices have been adopted to ensure international comparability of foreign trade statistics? [6] 4. a) What does an index number of industrial production attempt to measure? [4] b) Describe the scope and method of construction of the official and nonofficial indices of agricultural production in India. What are their limitations, if any, and what steps would you suggest for their improvement? [8 + 4]Group B 5. a) Define the concepts of product moment correlation coefficient between two random variables x and y and of correlation ratio of y on x. [8] If x and y are independent random variables show that  $r(x + y, x - y) = r^{2}(x, x + y) - r^{2}(y, x + y)$ where r(u, v) denotes the coefficient of correlation between u and 6.2) Show that, if np be a whole number, the mean number of successes in n independent trials with probability p of a success in any single trial coincides with the mode. [6] Eight mice are selected at random and they are divided into two groups . of 4 each. Each mouse in group A is given a dose of certain poison, . P, which is expected to kill one in four; each mouse in group B is given a dose of another poison Q, which is expected to kill one in two. . Calculate the probability that there may be fewer deaths in group B than in group A. [10]

$$\sigma^{2} = \frac{n_{1}\sigma_{1}^{2} + n_{2}\sigma_{2}^{2}}{n_{1} + n_{2}} + \frac{n_{1}n_{2}}{(n_{1} + n_{2})^{2}} + (m_{1} - m_{2})^{2}$$
[10]

- b) Show that the mean deviation from the median is less than that measured from any other value.
   (6)
- 4.a) Prove that

$$E = \frac{\stackrel{\wedge}{P} \stackrel{\wedge}{Q}}{(n-1)} = \frac{PQ}{n}$$

where P (= 1 - Q) is the proportion of objects possessing a particular attribute A in an infinite population and  $\hat{P}$  (= 1 -  $\hat{Q}$ ) is the proportion of objects possessing the attribute A in a random sample of n objects from the population concerned.

b) Instead of taking a sample in the above manner, if the objects of the sample are selected at random in succession until a fixed number more of objects possessing A is obtained in the sample, find the probability distribution of the size n of the sample and prove that

$$E(\frac{m-1}{n-1}) = P$$
 [10]

Nontness (for groups A and B). [4]

### EDIAN STATISTICAL DISTITUTE Statistician's Diploma Examination - May 1964

Paper II: Probability Theory and Statistical Methods
(Theoretical)

'ize | 4 hours

(incore irenz)

- a) Figures in the margin indicate full marks
  b) Answer <u>cix</u> questions in all not exceeding three from any group.
- o) Dae of calculating machine is not permitted.

#### Group A

- 1.a) Each of the n urns contains x white and y black balls. One ball is transferred from the first urn into the second, then one ball from the second into the thin term and so on. Finally one ball is taken from the last urn; find the probability of its being black.
  - b) There are n cards numbered 1, 2, upto n which are to be placed in n baskets similarly numbered. And the probability that each card is placed in the wrong basket, if the placing of cards in the baskets is random.
- Define the distribution function of a random variable and obtain its
  various properties. If X and Y are independent uniform random variables in [0, 1], obtain the joint mistribution function of X+Y and
  X-Y and find out whether they are independent.
- Define the moment generating function of a random variable and indicate
  to uses. Find this function for the random variable X with probability distribution

$$P(X = r) = {n \choose r} p^r q^{n-r}, 0$$

and hence find the mean and variance of X.

Also find the covariance between

$$\frac{X}{n}$$
 and  $\frac{n-X}{n}$  [16]

- 4. Define the bivariate normal distribution and find the marginal distribution of each variate. Indicates the conditional distribution of one variate when the other is fixed and hence find the mean and variance of this conditional distribution. (16)
- 5.a) State the weak law of large numbers and prove it for the case of a sequence of independent and identical random variables, when the variance is known to exist.
  - b) Obtain the Poisson approximation to the Binomial distribution giving the conditions under which it is true. [0]

### Group B

Slice that the least square estimates of the parameters in a linear model are unbinsed. How can one find confidence intervals for such parameters?

Define a  $\chi^2$ -distribution and find its mean and variance. Show that if X and Y follow independent  $\chi^2$ -distributions with degrees of freedom m and a respectively than Z = X+Y, has a  $\chi^2$ -distribution with men degrees of freedom.

8.	That is a maximum likelihood estimate out what are its proporties? Find the maximum likelihood estimate of the mean m of a Poisson population based on n independent observations from the population.	[14]
9.	Describe the method of evaluation of large sample standard errors of functions of sample magnets and use them to calculate the standard error of the sample fourth central moment m4.	(16)
10.	Explain the idea of regression of one variable on another and the connection between the regression coefficient and the correlation coefficient. Now does this idea extend to the case of more than two variables.	(16)
11.	Discuss the following points in connection with Wilcoxon's test:	
	i) Statistical model, (ii) the null hypothesis and the alternative,	
	iii) the test criterion, (iv) the critical region, (v) the distribution-free nature of the test.	
	Find the large sample distribution of Wilcoxon's test criterion under the null hypothesis.	[16]
	Heatness (for groups A and E).	[4]
	the Brain and a	

### BIDIAN STATISTICAL DISTITUTE Statistician's Diploma Examination - May 1964

Paper III : Sample Surveys and

Design and Analysis of Experiments (Theoretical) Full marks :100

fine 4 4 hours

- i) Figures in the margin indicate full marks.
  - ii) Answer six questions in all not exceeding three from any group.
- iii) Use or callady ing machines is not permitted

### Capun A

- Comment on the use and importance of sample surveys and the principal 1.0) [0] steps involved in their planning and execution.
- P) Discuss the problems that arise in the construction of a frame. [3] A city Directory, four years old, lists the addresses in order along each street, and gives the names of the persons living at each address. For a current interview survey of the people in the city, what are the deficiencies of this frame? Can they be remedied by the interviewers during the course of the field work? In using the directory, would you draw a list of addresses (dwelling places), or a list of [5] persons?
- 2.0) Define a probability sample.
  - b) A sample of size n is drawn one by one with equal probability ! from a population containing I units in two different ways (1) with replacement, and (ii) without replacement. Show that in either case, the sample mean is an unbiased estimate of the population mean. Obtain the variance of the sample mean in each of the two cases and indicate how you will estimate it.
  - A simple random sample of n villages is selected from a district containing I villages. Of these, im villages were found to have irrigation facilities. Tive an unbiased estimate of the total number of villages in the district having irrigation facilities. Give the variance of the estimate. How will you estimate the variance? [6]
- В. What is systematic sampling? liscuss the situations under which it can safely be recommended for adoption.

In a population of N(= nk)units consisting of a linear trend, show that a systematic sample of sir ) n is less precise than a stratified random sample with strata of size 2 k and two units per stratum if n > (4k + 2)/(k + 1).

- Α. Write critical notes on any three of the following :
  - a) Interpenetrating samples b) Regression method of cutiantion

  - e) Cost function in sample surveys
  - d) Cluster sampling.

[16]

### (200 to B

5. The Martindale Near Poster mad ine consists of four rectangular brass plates on each of which is for end on abrading surface consisting of special quality energy paper.

empiles of fabric are fixed rest on the energy surfaces and a mechanical levice news the bushes abrading the test specimens. The loss in weight after a given number of cycles is used as a criterion of resistance to abrasion. Five different rubber covered capitals A, B, C, D and E were tested in five different rubs of the machine according to the following scheme:

ī	an	1	Positi wa 2	in machine	(brass plates)
		Λ	Σ	c	D
	2	E	Λ	В	, <b>C</b>
	3.	D	£	٨	В
	1	C	L	Σ	٨
	<b>ز</b>	В	C	D	E

- identify the type of design and indicate briefly its community.
  - describe the magnic appropriate for this design. [8]
- 6. Describe the nonlysts of a Latin Source experiment with two missing observations of provides expectations for the standard error of the estimated triangle (Aforence, (You may assume that the observations lost relate to two different trundments). [10-6]
- 7. An experience was conducted as follows to compare the abilities of two culture radia to detect the presence of SALDONELLA organisms in specimens of facers. Samples a rea each of 222 specimens were grown on each radium. For each sample a ready was made as to whether presence (+) or absence (-) of the organism was found. The results are given below:

.,	Lied	iva (	No. of			
			7			
	_	-	5			
		*	0			
			210			
		Total	. 222	•		

- i) give your committee on the suitability of the design adopted.
- ii) analyaa the column [10]
- 8. Write short notes on the the of the following
  - a) Bold of residual foron in planning of experiments.

-----

t) Uniformity total : c) Initiphe eximers, procedures.

[8 + 6]

[6]

[8]

Menthuse (for groups A and a). [4]

#### DEDIAN STATISTI AL INSTITUTE

# Statistician's Diploma :xamination - May 1964

Paper IV : Applied Statistics (Theoretical)

#### Time t 4 hours

Full marks : 100

- a) Candidates will be required to answer questions from those two groups of subjects only for which they have registered their option.
- Soprate answer books are to be used for each of the two groups attempted.
- o) Figures in the margis indicate full marks.
- d) Use of calculating a chines is not permitted.

### CRUP A - ECC CAICS STATISTICS

(Answer any three quostions from this group; for neatness 2 marks only)

- Briefly describe the methcan of calculation of index numbers of industrial production, and emplyment. How are those index numbers useful in the measurement of changes in labour productivity?

  (10-6)
- 2. What do you mean by family budr t data ? How will you use these data for the estimation of income of sticities of demand for some items, say, foodgrains, cloth, and entertailment? How are these estimates of elasticities useful? (3+6+5)
- Clearly explain the following concepts :
  - (i) Gross national product (ii) Net national product (iii) National income at xxxx market price (iv) National income at factor cost (vi) National income at constant price (vi) National income at current price (vii) Domestie income (viii) Disposable income. ((16)
- 4. How will you use concentration (Lorenz) curve for the purpose of studying whather inequality of 'moome distribution has been reduced in the plan period in India ? Portive the form of this curve, when the income distribution follows Pareto's law. (9+7)
- 5. Write notes on any try of the following :

(8**+**8)

- i) business forecasting on the basis of time series
- ii) assumptions in Cobb-Douglas production function
- iii) input-output table
- iv) statistics of manufacturing industries in India.

Please turn over

### GROUP B - STITISTICAL GUALITY CONTROL

(Answer any three questions from this group; for neatness 2 marks only)

- (a) Explain what is near t by the statement that a process is out of 'Statistical control. What is meant by the term process espatility? (3+3)
  - (b) What are the main confidentions involved in the selection of 'rational sub-groups' and hard do they limit the ability of the control charts to detect significant causes of variation? (5+5)
- In the testing of a certain ballistic characteristic of ammunition it is desired that all values of this quality characteristic, fall between 1,600 and 1,800 units. x and R charts on the basis of samples of size 4 have been plotted from past samples. The R chart has shawn excellent statistical control with an R of 34 units. The x chart has shown a decided lack of control. Past experience had shown that this is inevitable so the contoring of the process is very difficult with respect to this quality characteristic.

It has been decided that it will be considerably more economical to test 16 items on an attribute basis than 4 items on a variable basis. In this connection it was decided to maintain a number defective chart. For this purpose the 'go', 'not-go' testing was adopted using special severe test limits. There are to be established at A+G so that the appropriate 'p' (artificial defectives) is 0.15 for the "above limits" (corresponding to the hot-go'limit) and is also 0.15 for the "below limits" (corresponding to the 'go'limit). Indicate :

- a) with specification limits of 1680 and 1800 as stated, what would be the values of those special severe test limits? (4)
- b) with 16 itoms food d in each sample, where would the control limits be placed on the negror defective chart?

  (4)
- o) if the mean of the process is at 1790 units, what would be the expected number of plotted points before a shift is detected?

  State clearly all the assumptions underlying your calculations.

  (8)
- 3. A vendor inspects his own product under a Dodgo-Romig Z% AOQL plan, screening all rejected lots before shipment. The lot size is 1000 and the assumed process average 1% (one percent). The purchaser inspects the same lots under a Dodge-Romig 5% LTPD plan, returning all rejected lots to the vendor. The plan used is taken from the process average column headed "0.51 1.00". Single sampling is used.
  - a) what is the probability that a % defective lot will pass both the vendor's and the purchaser's inspection?
    (8)
    - b) what is the probability that a 2% defective lot will pass the vendor's inspection and be rejected by the purchaser's? (8)

L.T.P.D. Percent Defective = 5.03

			precess	001:T 6V	%	
Lot Size		0.	51 - 1.00	. 1	.01 -	1.50
	n	С	ひむ え	_ <u>n</u>	c	100L %
601 - 800	100	2	1.2	130	3	1.2
801 - 1000	105	2	1.2	155	4	1.4
001 - 2000	130	3	1.4	180	5	1.6

### 102L - 3

Lot Size		.81	process - 1.20	average 7	21 -	1.60
	n	٥	Pt %	n	٥	P <sub>t</sub> %
601 - 800	65	2	8.0	65	2	8.0
801 - 1000	65	2	8.1	65	2	8.1
1001 - 2000	65	2	8.2	95	3	7.0

- 4. (a) Show how to determine the vulues of n and k for a variables sampling plan-known standard deviation when either an upper or lower specification is given and when AQL, & and LTFD, \$\exists\$ are stated.
  - (b) Show also how to obtain the o.c. curve of the sampling plan. (6)

### GROUP C - STATISTICAL METHODS IN CENETICS

(Answer any two questions from this group: for nextness 2 marks only)

- 1. What date do you collect for examining whother a gree is sex linked or not? Indicate the statistical analysis needed to establish such a linkage. Give a few examples of genes which are linked with the X chromosome. (24)
- 2. Write down the equation for eatimating the linkage parameter from the intercross data  $\frac{\Lambda b}{aB} \times \frac{\Lambda b}{aB} = Suppose we have estimates of the same linkage parameter and standard errors, from two types of data. How do you examine whether the two estimates are consistent? (24)$
- Describe the role of the discriminant function in plant selection.
   How is the discriminant function determined? Give an expression for the genetic advance due to selection by the discriminant function. (24)

Please turn over

(10)

### GROUP D - VITAL STATISTICS & DEMOGRAPHY

(Answer any three questions from this group; for neatness 2 marks only)

1. (a) Define a 'stationary ; . Trition' and explain how its characteristics are determined by litheral's functions. (10) (b) It is stated that the mortality of a body of professional men, say, qualified doctors, is lighter than that of the general population, because the average age at death of qualified doctors is found to be higher than that of the general population. Do you agree with this statement ? Sive reasons for your answer. (6) 2. (a) In a sample survey of a population, for each selected household, the birth schedulo gives, among other things, live births in the year preceding the date of survey, by sex, ago of mother at birth and order of birth and the population schodule gives, among other things, sex, age and marital status of members. What addional information would you require in the population schodule to enable you to extract the age-parity specific fartility rates of married women ? (illegitimate fortility is to be ignored) (6) (b) Define gross and not reproduction rates. Examine the appropriateness of each as an index of fertility, or :as a measure of the true repro-(10) ductivity of the population. 3. (a) What is a mortality index and what is the necessity for constructing ; such an index ? (b) Derive two mortality index a based respectively on direct and indirect standardisation, and indicate the circumstances in which the use of one or the other may be more appropriate. (10) 4. (a) Distinguish between estimation and projection of population. (4) (b) Explain how the population by sex and age, 5 years after the last census, may be obtained approximately when full registration data (B) are available. (c) How would you proceed when the registration data are not trustworthy and in what essential respect would your result be different in such (4) a caso ? (8+8)Write notes on any two of the following : a) Demographic transition b) Rospital morbidity statistics and their uses. c) Vital registration in India.

### GROUP E - EDUCATIONAL AND PSYCHOLOGICAL STATISTICS

(Answer any two quieti na from this group; for neatness 2 marks only)

Explain the terms is explain factors, factor leadings and communality
as used in Factor applysis.

Show that under Thurstone's multiple factor theory, the rank of the reduced correlation matrix of scores is equal to the number of common factors.

(24)

- Define reliability and validity of a test. Describe and compare the following methods of assessing the reliability of a test:
  - 1) Tost-Rotest method
  - ii) Parallel Form
  - iii) Split-Half technique
  - iv) Rational equivalence.

How would you assess the walidity of a test ?

(24)

3. A large number of applicants for admission to a course in statistics were given a selection test, and only those whose scores X in the test were greater than c, were selected. After one year of training, the selected candidates were given a test in statistics and their scores Y in this test are also available.

How would you use such data to estimate the correlation coefficient between the scores in the solection test and the scores in the statistics test for the population of all candidates?

Explain clearly the assumptions underlying the procedure. .

(24)

### Statistician's Diplom Examination - May 1964

Paper V i Mothods of Numerical Computation, Descriptive Statistics and Official Statistics (Practical)

Time 1 5 hours

Full marks : 100

- a) Figures in the margin indicate full marks.
- b) Use of Calculating machines is permitted.

### Group A

### (introc all questions)

The range of a continuous random variable is known to be (-1 to +1).
The values of the cumulative distribution function (c.d.f.) of the
random variable at two intermediate points -0.5 and 0.5 are given to
be .37648 and .03934 respectively. Find (a) the value of the cumulative distribution function at 0.25 and (b) the value of the density
function at 0.75.

 Compute the first and second derivatives of f(x) at x = 364 from the following table of values of f(x):-

x f(x)

301 5.70711026

302 5.71042702

303 5.71373201

304 5.71702770

305 5.72531178

306 5.7255510

[13]

[5]

L

### Croup B

(Answer three questions from this group of which question No. 3 is

Zoopulsory of India and the United Linguon in 1931.

Age-grouping	Posulatio	m (lokhe)	
164-61201116	India	U. K.	
0 - 5	214	18	
5 - 10	250	19	
10 - 15	222	20	
15 - 20	157	18	
20 - 25	145	16	
25 - 30	161	14	
30 - 40	257	27	
40 - 5C	184	25	
50 - 6C	120	19	
above 60	100.	17	

- a) Draw the two frequency distributions on the same graph paper.
- b) Draw the cumulative age-distribution (egive) curves of the two
  populations on the same graph paper.

### 3(contd.)

- c) Calculate the median ages and the semi-interquartile ranges of the two distributions from the ogive curves you have drawn.
- d) Write a short note comparing the ago-distributions of India and the U.K. on the basis of (a), (b) and (c). [4]

[4]

 1000 groups of 12 students each wore observed and the number of students in each group who habitually wear glasses recorded. The following table shows the data.

no. of students who wear, glasses	0	1	2	3	4	5	6	7	8	9	10	11	12	total
no.of	6	44	124	209	232	196	116	52	16	. 4	1	٥	٥	1050

- a) Estimate the probability that a student selected as random means glosses, and, on the basis of this estimated probability, calculate the binemial frequencies for the above data. [2 + 8]
- b) Calculate the \( \frac{\partial}{x} \) while of goodness of fit of the binomial distribution and examine if this value is significant. [6]
- 5. The following table shows the yield in ounces of dry bark (X<sub>1</sub>), height in inches (X<sub>2</sub>) and girth in inches (X<sub>3</sub>) of 15 jinchona plants.

serial no.	<b>x</b> <sub>1</sub>	x <sub>2</sub>	х,		serial no.	x <sub>1</sub>	х <sub>2</sub>	х,
1	42	21	3		9	10	6	3
2	25	7	2	÷	10	20	4	4
3	10	5	1		11	27	ė	4
4	44	16	4		. 12	13	7	3

, 6	38	12	3		14	27	6	3
' 7	32	. 13	4		15	55	16	7
8	25	5	2					

- a) Obtain the equation of linear regression of  $X_1$  on  $X_2$  and  $X_3$ . [10]
- b) From the above equation estimate the yield of dry bark from the values of X<sub>2</sub> and X<sub>3</sub> corresponding to plants with serial numbers
   1, 3 and 13.
- o) How much of the variation in X<sub>1</sub> is explained by the regression and how much by deviations of observed values from regression? [4]

 The following table shows yearly public investments under Central Covernment for the financial years 1901-1902 to 1926-21.

year	public investment under Central Government (crores Rs.)	year '	public investment under Contral Government (croresRr.)
1901 - 1962	17.45	1911 - 1912	31.37
1902 - 1903	20.35	1912 - 1913	35 - 37
1903 - 1904	21.42	1913 - 1914	35.32
1904 - 1905	23.51	1914 ~ 1915	39.85
1905 - 1906	29.97	1915 - 1916	45.91
1966 - 1967	29.23	1916 - 1917	48.17
1907 - 1900	74.23	1917 - 1910	46.85
1900 - 1909	35.00	1918 - 1919	40.96
1909 - 1910	27.39	1919 - 1920	36.33
1910 - 1911	32.20	1920 - 1921	43.8G

a) Plot the data on a graph paper.

- [4]
- b) Fit a second degree polynomial troud to the data and draw the graph of this polynomial on the graph of the data, by platting five selected points.
- [8]
- c) Write brief commonts on the nature of growth and fluctuations of governmental investments during the period indicated.

[4]

### Group C.. ..

# (Answer <u>all</u> questions)

- 7. Select any three of the following items:
  - a) Foreign Trade, (b) Irrigation, (c) Industrial Production,
  - d) Land Utilisation Statistics, (e) Mining.

زر:

For each of the three items selected, write down

- i) the mass of publications from which you can get the required information in India.
- ii) the office from which the publication is issued,
- iii) periodicity of publication and
- iv) the time lag in publication.

[9]

 Collect relevant information from the publications supplied in respect of changes in (1) per capits not national output in Lulia and (11) index number of industrial production in Lulia for the latest available 10 consecutive years.

Comment on the salient features of data thus collected.

[16]

# NOLAN STATISTICAL DISTRUTE Statistician's Diploma Examination - May 1964

Paper VI: Statistical Lethods, Design and Analysis of Experiments and Sample Surveys (Practical)

Time : 5 hours

Full marks : 100

- i) Figures in the margin indicate full marks.
- ii) Use of a letting machines is permitted.

### 1. 1. Ja A

### (Ammer all questions from this group)

1.a) In a fertilizer experiment two sots of 10 plots of equal area, were selected at random. All the plots in the first set received fertiliser A, while all the plots in the second set received no fertiliser at all. The yields of wheat grown on these plots are given below:

Yields (in lbs.)
from plots with
fertiliser A:

512, 432, 470, 533, 571, 402, 450, 396, 412, 475

Yields (in 1bs.) from plots with no fertiliser:

317, 378, 575, 402, 411, 370, 501, 430, 472, 503

It is claimed that the fortiliser A is effective in increasing the yield per plot of wheat. Do you agree? Give reasons.

 The following table gives for a sample of married women, the level of education and marriage adjustment score;

marriage - adjustment score

level of education

	Acta Joa	low	high	very high
College	24	97	62	58
High School	22	28	30	41
Eddle School	32	10	11	20

Can you conclude from the above, that higher the level of education, the greater is the degree of adjustment in marriage?

[10]

[10]

2.a) Use any appropriate statistical test to examine that the following 4 samples come from the same population.

gamele nos.

	, II	III	IA
13	24	12	4

# (contd. from Group B)

 Draw up a balanced confounded design for a factorial experiment involving three factors A, P, C each at three levels C, 1, 2 using blocks of 9 plots, in 4 replications and with partial confounding of only the triple factor interaction.

[15]

### Graup C

(Answer hath the questions from this group)

6. A simple sample of n = 50 households was drawn without replacement from a willage in which there are in all il = 250 households. It was found that amongst the sampled households, there were only 8 households each possessing a translator radio. These households had respectively 3, 5, 3, 4, 7, 4, 4 and 5 members.

Estimate (a) the total number of households in the village possessing transistor radios (b) the total number of persons in these households; and calculate the standard errors of these estimates. [15]

7. For a certain survey, it was been decided to use a stratified sampling design, using 5 strata, sampling within each stratum being with replacement and with equal probabilities. Let \(\mathbb{U}\_i\), \(n\_i\) and \(\sigma\_i\) denote respectively the population size, sample size and the standard deviation of the characteristic under study in the i-th stratum. Let \(\mathbb{C}\_0\) = Rs.500 be the overhead cost for the survey, \(\mathbb{c}\_i\) the cost for sampling and processing a single unit from the i-th stratum and \(\mathbb{C}\) = Rs.10,000 the total cost fixed for the survey. The numerical values of these constants are given below.

etratum numbor (i)	r <sub>i</sub>	· oi	c <sub>i</sub> (Rs.)
1 .	37800	, 28.5	3.50
2	52600	. 18.6	2.75

(15)

- a) Candidates will be required to answer questions from those two groups of subjects only for which they have registered their option.
- Soparate answer books are to be used for each of these two groups. attempted.
- c) Figures in the margin indicate full marks.
- d) Use of Calculating Machines is permitted.

# GROUP A . ECONOMIC STATISTICS

(Answor all questions)

 Average weekly wages (in dollars) in manufacturing industries of B.S. along with the consumer price index numbers are given below for 14 months. Compare the change in money wage with that in real wage from November 1955 to December 1956.

month	weekly wage co	nsumer price index
1955 November	. 79.52	115.0
December	79.71	114.7
1956 January	78.55	. 114.6
Pebruary	78.17	114.6
March	78.78	114.7
April.	78.99	114.9
· Мау	79.00	115.4
June .	79.19	116.2
July .	79.00	117.0
Augus t	79•79	116.8
September	.81.40	117.1
Oatober	82.21	117.7
November	. 82.42 .	117.8
Docember	84.05	118.0

 On the basis of monthly sales (in million dollars) of a certain commodity for the years 1951 to 1955, the following calculations were made.

Trend : y = 25.74 + 0.455 t where origin is at January 1951

t = time unit (one month)

y - monthly sales.

Seasonal Index	month	Jan	Feb	March	Apr	Ису	June	July	Aug	Sopt	Oot	No₹	Deo
	index	79.6	76.6	94.9	97.5	105.5	97.9	85.1	89.2	102.1	121.9	113.4	136.3

Estimate monthly sales for 1956.

J. Index numbers of domaid for agricultural products (y), prices of agricultural products (x<sub>1</sub>) and national incomo (x<sub>2</sub>) are given below for the years 1950 to 1959. Obtain the elasticities of domaid for agricultural products with respect to price and income. What will be the change in demand, if income increases by 5 p.c. and price rises by 2 p.c.?

Year	У	<b>x</b> <sub>1</sub>	*2
1950	102	89	90
1951	98	93	96
1952	. 100	100	100
1953	105	91	98

1955	120	72	96
1956	120	75	100
1957	127	91	113 -
1958 .	118	91	114
1959	134	96	125

### GROUP B : STATISTICAL QUALITY CONTROL

( Answer any two questions )

 (a) The following table gives the number of missing rivets noted at aircraft final inspection:

Air plane number	Number of missing rivets	Air plans number	Number of missing rivets	Air plano number	Number of missing rivots
1 2 3 4 5	8 16 14 19 11	11 12 13 14 15	23 16 9 25	21 22 23 24 25	10 22 7 28 9
6 7 8 9	15 8 11 21 12	16 17 18 19 20	9 9 14 11 9		

Compute trial control limits and plot a control chart for number of defects per unit. What would be the achievable standard value of the number of defects per unit?

(16)

(b) A control chart for defects per unit uses probability limits corresponding to probabilities of 0.975 and 0.025. The central line on the control chart is at 2.0. Determine the correct position of the upper and lower control limits when n = 5, i.e. 5 units are inspected at a time.

The lot size N is 2000 in a certain AOQL inspection procedure. The desired AOQL of 1.0% (one percent) can be obtained with any one of three single smapling plans. These are n = 36, c = 0; n = 80, c = 1; and n = 150, c = 2. Which plan will involve the minimum total inspection, considering both Sampling inspection and screening of rejected lots, if a large number of lots of 0.25% defectives are submitted for acceptance?

(25)

3. (a) In a cortain variables recentance plan, samples of 4 are tested from each lot. The results are plotted on an x, R control chart with control lines drawn at the usual 35 limits. If the average of a sample of 4 lies within the control limits on x chart and the range also lies within the control limits on the R chart, a lot is accepted; otherwise rejected.

Assume that after a long period of satisfactory lots, a lot is submitted that is 10% defective. Assume for each lot a Normal distribution for the variable characteristic with a of equal to that used in computing the control limits. For the 10% defective lot the average may be assumed to have shifted to such a high value that the highest 10% of the frequency distribution is above the upper specification limit. Compute the probability that this defective lot will be eccepted?

(b) A sample of 5 bearings is taken from an automatic grinder and their diameters measured. The results are 1.003, 1.001, 0.996, 0.997, 0.998. The process is coraidered satisfactory if 97% of the output lies within the range 1 ± 0.005. On the basis of this sample, decide whether the grinder needs adjustment.

### GROUP C - STATISTICAL METHODS IN GENETICS

(Answer all questions from this group) .

 The following data relate to sex of children born to mothers of different (O, A, E, AB) blood aroups.

Sox of	Blood	group	of noth	er
child_	0	Λ	9	لىم
0	200	192	156	68
φ	160	180	150	75

Examine

- (a) whether the over-all sex ratio is 1 : 1,
- (b) whether the sox ratic is different for different bio. groups of mothers, and
- (c) whether the f' area for C and Q children of mothers with blue group as given in the above table show. a reale consistent with some previous data giving 400 C and 550 Q children for mothers of 0 group.

. (25)

 The mean values, standard deviations and correlations of three characteristics y, x, x in a population are as follows:

	У	2,	× <sub>2</sub>	
mean	200	35	46	
.b.a.	6	3	2	

	Correlations				
		*1	*7		
У	)	.50	.50		
x,	.60	1	.40		
x2	.50	.40	1		

- (a) Compute the linear function of  $x_1$  and  $x_2$  useful in selecting individuals for the characteristic y.
- (b) How should the selection is done on the basis of x<sub>1</sub>, x<sub>2</sub> (i.e., what value should the lir with an adstrmined in (a), exceed for selecting an individual) if, in the long run, 25 p of the available individuals are selected. Assume normality of distribution.
- (c) What is the mean value of y in the selected group.? (25)

000000

# GROUP D . VITAL STATISTICS & DEMOGRAPHY

( Answer any two questions )

 The following data are taken -s relating to a certain European Community:

Table 1 : Population of women at ages 15 - 44

	Year		Year B		
group Age	No. of married women	No. of ich-	No.of married	No.of non- married women	
15 - 19	1,000	8, 10	٠ ٢٥٥	7,500	
20 - 24	5,200	4,~0	5,100	3,400

35 - 39	.060	-	.060	-
40 - 44	•020		.020	
No. of birth	3,804	54	3,752	37

Considering the year A to be the standard year, calculate indexes to show the relative fortility experiences of the two years and externs the inadequacy of the comprises of the respective crush birth rates. (25)

. ...... consuses 1

Year	Population (in lakhs)
1931	2,790
1941	3,187
1951	3,611
1961	4,392

Estimate the expected population of India in 1971, on the basis of Estimate the exposure the growth equation:  $P_t = P_G$  .

where  $P_t$  and  $P_o$  are the populations at times t and o respectively, and  $\delta_t = \alpha + \beta t$  is the momentary rate of

growth at time 't'. Comment on the reasonableness or otherwise of this estimate from other considerations.

3. The following table gives part: ulars about White Females, United States, 1950 #

Ago group (year)	Ago-specific fortility rate	Proportion surviving from birth to mid- point of Age-group
10 - 14	•0004	•96928
15 - 19	•0700	.96693
20 - 24	<b>.</b> 1904	•96338
25 - 29	.1651	-95915
30 - 34	.1026	•95387
35 - 39	.051/:	. 94658
40 - 44	.0145	-93569
45 - 49	.0010	•91912

Calculate the average length of the generation of the white females (25) on the basis of the above data.

(25)

# GROUP E . EDUCATIONAL AND INTERIOR STATISTICS

(Answer all Questions)

 The following table gives the ranks assigned to various moral items, by employers and employees.

Items	Employer's Ranking	Employees' Ranking
1	1	7 .
2	2 .	3
3	3	1
4	4	5
5	. 5	8
6	6	4
7	7	6
8	8	. 2

Indicate whether there is any relationship between the ranks assigned by the two groups. Comment on the results obtained by using product moment Correlation Coefficient.

(16)

2. The Correlation matrix for 5 test variables is given below :

	1	2	3	4	5
1	-	-	-	-	-
2	•50	-	-	-	-
3	.41	-58	-	-	-
4	•30	•44	•54	-	-
5	.21	•34	•57	.62	-

Assuming that the tests may be described by two common factors, obtain (i) the factor matrix (ii) the first factor residuals. On the basis of the first factor residuals can you justify the above assumption.?

11.

3. The following table represents the judgements of 95 members of a wellknown symphony orchostrateoncorning preferences for music of eight composers. Compute the scale values for the eight composers represented. The table gives the values of p<sub>ij</sub> where p<sub>ij</sub> is the proportion of times where computer j is preferred to composer i.

Value of P<sub>11</sub>

				- 1	<u> </u>		
j 1	2	- 3	4	₹ 5	4	7	8
1 2 3 4 5	.242	.842 .895	.916 .968 .853	.634 .989 .547 .189		.411 .758 .126 .053 .084	.126 .199 .053 .032 .042 .116

PŢ

[8]

- Candidates will be required to answer questions from that group only for which they have registered their options.
- ii) Figures in the margin indicate full marks.

Group A : <u>Economic Statistics</u> -(Econometries)

(Caswor any <u>fivo</u> questions)

- 1. a) What is the problem of identification in the estimation of simultaneous linear relationships? How would you proceed if you find one of the relationships is (i) under-identified, (ii) over-identified?
  - Examine whother the following model is identified or not and describe how you would estimate the parameters involved.

$$D = \alpha_1 P + \alpha_2 y + u_D$$

$$S = \beta_1 P + \beta_2 v + u_S$$

$$D = S$$

Here the endogenous variables D, S and P are the demand, supply and price variables and y and w are the exogenous variables income and weather respectively.

- Write a note on the applications of the lognormal distribution in economics and the related problems of estimation. When is the bivariate lognormal distribution needed and how are the parameters estimated? [20]
- 3. a) Describe the production-function with constant elasticity of substitution. Is it any improvement on the Cobb-Douglas production-function?[10]
  - b) What are the methodological problems implied in fitting a productionfunction to time-series data? [13]
- 4.a) Write a note on the generalised leant squares estimation of parameters in single-equation-models. What are their properties? How are they needed in the statistical analysis of economic data? [12]
  - b) If  $X_t = a + bt + \epsilon_t$

where  $\boldsymbol{c}_{\varphi}$  has mean zero and forms the first order autoregressive process given by

derive the generalised estimate of b.

- (3.a) What are the measures of inequality of inequa and wealth distribution? How would you estimate them?
  - b) Now would you set about studying changes in income-distribution over time in India? What are the methodological and practical problems involved?

6.	Examine in detail the problems of formulation and of ostication of depand relationships from cross-section and/or time-series data.	[5c]
7.0)	What are the open and closed Lcontief's models of the economy? How are these models made dynamic?	[10]
ъ)	Examine the limitations and difficulties in constructing and using the input-output tables in the context of an underdeveloped or developing country.  ocoOcoc	[1c]
	Croup B + Zechno-Conmercial Statistics - (Statistical Quality Control)	·
	(Answer any four questions)	
1.	Discuss briefly the problems ordinarily faced in starting and maintaining control charts in a manufacturing plant, with special reference to the statistical principles useful in dealing with them.	. [25]
<b>2</b> 4.	What is marrow limit gauging? Examine the advantages of and the problems involved in the use of marrow limit gauging, for control of a measurable characteristic.	[25]
3.a)	Describe the salient features of the Mil Std. 105 tables. How would you select a suitable plan from these tables for normal inspection?	[20]
<b>ن</b> )	Examine the following statement. The Mil Std tables are more appro- priate when the supply is regular and continuous whereas the Dodge Romig plans are more suitable when supply is occasional or sporadio.	
4	Describe the statistical problems involved in determining the optimum operating conditions of a process affected by several variable.	les. [25]
.54.	Write notes on any three of the following:	
	a) Role of standardisation in quality control	
	b) Specifications and process capabilities	
	c) Continuous sampling inspection plans	
	d) Cumulative aum charta	(06)
	e) OC curve and indifference quality	[25]

Group C - <u>Bicmetric Methods</u> ( Answer any four questions )

†. The distribution of the number of children per married couple can be described approximately by the formula

 $p(x) = \begin{cases} 1 - \alpha & \text{for } x = 0 \\ \alpha & (1 - 0) & 0^{x-1} & \text{for } x = 1, 2, \dots \text{ ad inf.} \end{cases}$ 

- (a) Work out the probability that a couple selected at rendem will have x children of whom y are albinoss. x ≥ y = 0, 1, 2, ......., State clearly any extra assumptions that you may use in computing this probability.
- (b) If a simple random sample of n couples is drawn with replacement from the population of all couples, and for each sampled couple the number of children x, and the number of albino children y are noted, how will you estimate the parameters α, β, y and 6? (2c)

where  $\alpha$ ,  $\beta_1$ ,  $\beta_2$  and  $\beta_3$  are certain parameters.

Measurements on C, L, B and H  $^{\prime}$  are available on n = 26 male skulls.

- (a) How will you estimate the parameters ?
- (b) It has been suggested that a simplor formula

. C - a L B B'

may do as well. Bow will you examine this point ?

(c) In any case, since C is a volume, dimensional considerations suggest that  $\beta_1+\beta_2+\beta_3=3$ . Row will you test this hypothesis?

Describe in datail all the assumptions that are needed to validate the statistical techniques adopted.

 For a mixture of two Normal populations with possibly different means but same variance, work out the first four central moments.

Describe how you will estimate the four parameters namely the two means, the common variance and the mixture-ratio, on the basis of a large sample drawn from such a population.

(: :

The longths of the ten fingers are evailable for a large number of adult human males. Formulate some hypothesis of symmetry of those measurements which it may be of interest to examine on the basis of those data. Describe the test procedures that you would adopt.

(2:

 Describe Fisher's technique of discriminant function for classifying, on the basic of multiple measurements, an individual into one of two given populations.

Work out the probability of mis-classification by this technique when the <u>spriori</u> probability is a that the individual belongs to either of two given multivariate Normal populations, with a common dispossion matrix.

# Group D - Design & Analysis of Experiments

( Answer any four questions )

Assuming that the yield of a plot is built up additively of the
offects of the plot and of the treatment applied on it, work out the
expected values of the mean squares for the different components in
the analysis of variance for a randomised block experiment.

.(1"

Describe how to estimate the increase in efficiency due to the use of a randomised block design instead of a completely randomised one, from the results of randomised blocks experiment.

(•c)

 Define a Partially Balanced Incomplete Block design with two associate classes. **(5)** 

Examine whether the design given below (involving 12 treatments in 8 blocks of 3 plots each) can be considered as Partially Balanced with two associate classes.

If the above design is Partially Balanced write down all the parameters of the design; if it is not, demonstrate just which requirement is not fulfilled.

Write down computational instructions for the intra-block analysis of the results of an experiment with the above design. (1

Ploage turn over

3.	Give a design for a tarcplicate experiment involving 6 factors, each at 2 levels, using blocks of 8 plots.	(10)
	Describe the attractive features of the design chosen by you and explain how the experimental results are to be analysed.	(15)
4.	Describe the method of $\mathfrak{st}_0$ epost ascent for locating the peak of a response surface.	`(1.)
	Show that prior knowledge of the slopes of the response surface (in different directions) is necessary for using this method.	<b>(</b> ຄ)
	How do you propose to determine the slopes ?	<b>(</b> 7)
5•	An astrologer claims that given the exact time of birth of a newborn baby, he can predict whether the baby will live for at least one year or die before attaining the age of one. Design an experiment to test his claim. Explain carefully how you will use the fundamental princit of randomisation, replication, and error control in designing this experiment.	
		_
	. Group (E): Sample Surveys - (Theoretical Aspects)	
	(Answer any four questions)	
1.	Dofine the following terms	
	a) Purposive Sampling	
	b) Simple Random Sampling .	
	c) Response Errors	
	d) Interpenetrating Subsamples	
	e) Correlogram	[25]
2.0)	How is the population mean estimated when the sample is drawn one by one with varying probabilities without replacement?	
b)	How is the variance of the estimator of population mean estimated for the above scheme?	
c)	Examine if this estimate of variance could be negative.	
<b>d)</b>	Describe two schemes of sampling with varying probabilities without replacement for which positive definite estimators of the variance (of the estimate of mean) are available.	
o)	Describe a method of systematic selection with warying probabilities	· [25
3.4)	Show that under certain assumptions the regression estimator is better than the ratio estimator of the population mean.	
p)	How would you estimate the regression coefficient for a combined regression estimator when stratified simple random sampling is used?	
c)	How is double sampling used for regression estimation when the population mean of the 'auxiliary variate is not known in advance?	[25]

### Group (E) (contd.)

- 4.a) Given the strate, how would you allocate the sample size to different strate to estimate the population mean? Give reasons.
  - If there are only two strata in would you distribute your sample over them, to estimate the difference between the strata means? Give reasons.
  - c) Describe stratification after sample selection.
  - d) Describe a self-weighting stratified two-stage design.
- 5.a) what is + a problem of non-response?
  - b) Derive the expression for the optimum fraction of the non-respondents (in a mailed questionmaire survey) to be interdessed.
  - c) Describe Politz and Simmon's scheme of tackling the problem of not-at-homes. (2)

# Group (G) Statistical Inference

### (Asser any five questions)

- 1.a) Define 'unbiasedness' and 'consistency' of an estimator. [6]
  - b)  $T_n$  is a biased estimator of a parameter  $\theta$ , based on a random sample of size n, and  $\Sigma(T_n) = \theta + b_n$ . If  $b_n \to 0$  and  $V(T_n) \to 0$  as  $n \to \infty$ , show that  $T_n$  is a consistent estimator of  $\theta$ .
  - c) In order to estimate the proportion 6 of a certain characteristic in a large population, a random sample of size in in taken and the number of individuals with the characteristic counted. This counting involves an error which may be considered constant for every given in, and is of the order \(\frac{1}{\pi\_1}\). Examine if the sample proportion is a consistent estimator of 6.
- 2.0) Examine if the distribution

$$f(x, p, \alpha) = \frac{\alpha^p}{f(p)} e^{-\alpha x} x^{p-1}, x \ge 0$$

admits of a sufficient estimator of a.

- Show that if t is any unbiased estimator and T a sufficient statistic for a parameter 6, then E(t / T) is an unbiased estimator which has a smaller variance than that of t.
- c)  $x_1, \ldots, x_n$  is a random sample from a normal population  $N(\mu, 1)$ .

  1) Show that  $t = \frac{1}{n} \sum_{i=1}^{n} x_i^2$  is an unbiased estimator of  $\mu^2 + 1$ .
  - Assuming that the sample mean x̄ is a sufficient statistic for μ. find an unbiased estimator of μ<sup>2</sup>+1 which has a variance smaller than that of t.

[6]

3.n)	Describe an iterative method for solving the maximum likelihood equations for two parameters and for obtaining the variances and covariances of the estimators.	[1 <sub>0</sub> ,
υ)	For a normal distribution N(u, o2), u is known but o2 is not known. Show that the sample variance is not the most efficient	
	estimator of $\sigma^2$ , and obtain the maximum likelihood estimator of $\sigma^2$ .	[13]
4.0)	Show, with proofs, how to construct a most powerful test for a simple hypothesis against a simple alternative.	[t]
ъ)	In this test 'unbiased'?	[5]
c)	For the normal distribution N(C, o2), derive a uniformly most power-	
	ful test for the hypothesis o2 = 0 against alternatives of the	
	$t_{\rm MT}e^{-o^2}.$	[8]
5.a)	Define a 'composite hypothesis'.	.[5]
<b>b)</b>	Describe the likelihood-ratio mothed for constructing tests for compasite hypotheses.	[7]
c)	There are k normal populations $\Pi(\mu_1, o^2), \ldots, \Pi(\mu_k, o^2)$ . A random	
,	sample of size n has been taken from each of the $k$ populations. Obtain the likelihood ratio test for the hypothesis $\mu_1=\ldots=\mu_k$	[0]
S.a)	How are shortest confidence intervals for a parameter defined by Neymon ?	[6]
υ)	How are these intervals related to best critical regions for testing 'hypotheses regarding the parameter?	[6]
ċ)	Illustrate the above by considering the problem of finding a confidence interval for the mean of a normal population, whose variance is not known.	.· [0]
7.	Write a short essay on Wald's theory of decision functions, explaining Bayes and minimax procedures, randomised decision function admissible and complete classes.	[20]

# INDIAN STATISTICAL INSTITUTE Statistician's Diploma Exhaination - May 1964

Paper IX : Subjects of Specialisation - II

Timo : 4 hours

Full marks : 100

- a) Candidates will be required to answer questions from that group only for which they have registered their options.
- . b) Figures in the margin indicate full marks.

Group A - Economic Statistics (Indian Economics and Economics of Planning)

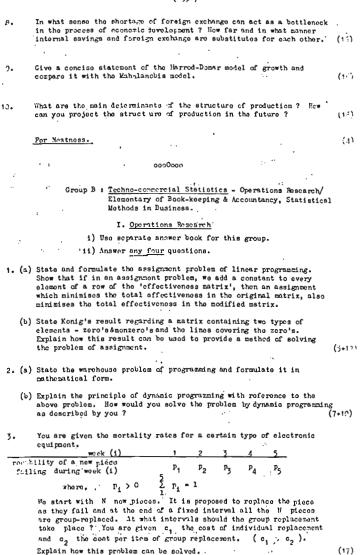

(Answer Six questions in all - not exceeding three from any Section)

### Section I

- 1. What are the main features of the Community Development Projects and National Extension Service of India? Examine their usefulness for raising agricultural productivity. What changes in their organization will help in increasing agricultural production faster?
- Outline the main arguments for setting up of public enterprises in India. Also give a brief account of the important industrial enterprises started by the government in recent years. (16)
- Describe the present system of Industrial finance in India. Give suggestions for improving it and also indicate what, at present, is being done in this regard.
- 4. Provide an analytic description of the existing tax structure in India. What changes would you like to make in it with a view to (a) making it more progressive, and (b) providing more resources for economic develorment?
- Give a aketch of, and critically commont on, India's balance of payments
  problems since the end of Socond World War. To what extent India's
  foreign exchange difficulties are a consequence of Plans. (16)

### Section II

- Critically examine the thesis that the emergence of agricultural surpluses is a necessary pre-requisite for industrialization of everpopulated areas. Account for the smallness of marketable surplus in Indian agriculture. (1:)
- What, in your opinion, is the main strategy of Indian Planning?
   Illustrate your answer with examples from Indian Five Year Plane.

Please turn ever

- 4. (a) Explain the problem of Inventory control in the case of deterministic demand and derive the economic lot size formula in the case of constant demand rate R per unit time, with unit set up cost Cz; unit holding cost C., and unit shortage cost C2.
  - (b) Explain how linear programming can be used in solving production · (12+. scheduling problems.
- 5. (a) For case of a quoue with k service channels, each exponential, with mean service rate A and Poisson arrivals with mean rate A, derive the recurrence relations for the steady state probabilities p, the probability that there are n units in the system at any instant of time. Solve for n. time. Solve for pn.
  - (b) For the case of a single channel k = 1 (in (a) above), derive the distribution of the waiting time of an arrival.
- (c) Define Erlangian service time distribution. What is its usefulness and importance in quoueing problems ? Por NEATHESS Group B , I (alternative) - Elements of Book-keeping & Accountancy
  - i) Use separate answer book for this group.
  - ii) Answer any four questions of which question no. 1 is compulsory.

P and Q are partners in a Firm sharing Profits & Losses as P 80% Frapulsory and Q 20%. Their Trial Balance as on 31st December 1963 is given below.

1755 6

3. On examining the Bank Pass Book of X Co. Ltd., it is found that the belance shown on 31st March 1955 the close of the Company's financial year, differs from the Bank belance R. 23,650 shown by the Cash Book on that date. From a detailed comparison of the entries it is found that i-

Please turn ever

a) No. 2,060 is entered on the Cash Book as paid into Bank on Jank March 1955, but not credited by the Bank until the following day.

- b) Bank charges &. 70 on 31st March 1955, are not entered in the Cash Book.
- c) A bill for R. 5,500 discounted with the Bank is entered in the Cash Book without recording the discount charge of R. 270.
- d) Cheques totalling fs. 16,720 were issued by the Company and duly recorded in the Cash Book before 31st March, 1955, but had not been presented at the Bank for payment until after that date.
- e) On 25th March 1955, a debtor paid Rn. 1,000 into the Company's Eank in settlement of his Account in the Company's Sales Lodger, but no entry was made in the Cash Book of the Company in respect of this.
- f) No entry has been made in the Cash Book to record the dishonour on 15th March 1955, of a Cheque for Rs. 550 received from B. Ghatak.

You are asked to show the necessary corrections in the Cash Book of X Co. Ltd. and to prepare a statement reconciling the Cash Book Balance as amonded with the Balance which should appear in the Bank Pass Book. [13]

Give the correcting journal entries and prepare the Suspense Account. (14)

- 5. (a) Why Stock-in-trade is being included in Financial Accounts ? "
  - (b) In what way correct valuation of Closing Stock has direct bearing upon the correct ascortainment of the not profit of a trading concern?
  - (c) What should be the correct method of valuation of Stock-in-trade ? (3.5+6
- 6. Write notes on 1
  - a) Contingent Liability.
  - b) Goodwill.
  - o) Accommodation Bill.
  - d) Work-in-Progress.

(14)

#### Il. Statistical Methods in Business

- i) Use separate answer book for this group.
- ii) Answer any two questions.
- Explain the six major steps involved in setting up and control of a
  job. Explain the terms, job standardisation, job review and analysis,
  job evaluation. (15)
- 2. (a) Suppose you are given data regarding monthly sales for a manufacturing company for the years 1953 to 1963. How will you use this data for forecasting the sales in the year 1964 for each month January to December?
  - (b) The market demand for electric refrigerators in the U.S. has been analysed in the following equation

 $Y = 2912.8 + 34.4 x_1 + 35.6 x_2 + 2024.3 x_3$ 

y = number (in thousands) of refrigorators sold.

x - disposable personal income in 1939 dollars.

x2= change in disposable personal income from the previous year.

x,= time (1925 = 1)

Explain the meaning of the terms and variables used, how this equation has been set up and what type of data has been used. (7+8)

- 3. (a) What are the important uses of sampling in Economics and Business ?
  - (b) Explain the term "Market research". What are the various types of marketing research activities?
  - (c) Explain the term "consumer-panel" and its use in market research. (5+6+4)

0000000

#### Group D - Design & Analysis of Experiments (Combinatorial Aspects)

(Answer any four questions)

 Prove that where p is a prime number, the class of residues modulo p, form a finite field. Give the addition and multiplication table for a finite field with 5 elements.

Explain how you will construct a finite field of order p<sup>n</sup>, where p is a prime number and n a positive integer. Construct a field awith 9 slements.

Mention some applications of Minite fields in Statistics. (25)

Define a balanced incomplete block design (BIBD) and obtain the
relations and inequalities amongst its parameters. Give five positive
numbers v, b, r, k,c,d, astisfying these relations such that no BIBD
with those parameters exists. Substantiate your answer with a proof.

Show how a BIED with r=k can be used to obtain two more BIBD's. State whether this process is reversible.

Please turn over

- 3. Define an orthogonal array of strength 2 and indicate the relation between such an array of index unity and a set of mutually orthogonal Latin Squares. Prove that the existence of an array 2 1 8 8, 2 implies the existence of s - 1 mutually orthogonal Latin Squares (25) of order s. Define intra block sub-group in a confounded symmetric factorial 4. experiment. Obtain the intra block sub group in a 26 experiment with factors A, B, C, D, E and F, confounding the 3-factor interactions ABC, BDE and CDP. Develop the intra block to obtain the complete design. What other interactions are confounded in this . design. (25) What is generalised interaction. Construct two replicates of a 3 5. design involving 3 factors A, B, C at three levels each, confounding. the effects ABC, and BC2, in the first replicate and AB and ABC in the second replicate. (25) Define a rotatable design and state the necessary conditions that a second order rotatable design has to satisfy. Construct a rotatable design for a 310 exportment, using the balanced incomplete block design with parameters. v = 10, b = 15, r = 6, k = 4, and λ=2. (25) Group E - Sample Surveys (Organizational Aspects) (Answer any four questions)
- 1. Discuss the questions that require consideration at the planning stage

of sample surveys.

How will you resolve these questions if you are asked to prepare a design for a repetitive sample survey for construction of annual indices of unemployment in a big city of India.

2. You are required to prepare a budget for a sample survey for estimating annual production of major crops of your State. Enumerate the different stages of work and estimate the work-load of each stage. Then prepare the budget estimate showing the details of recurring (25) and non-recurring items of expenditure.

- 3. (a) Write a note on the supervisory functions relating to different stages. (15) of work of in connection with a statistical surveys.
  - (b) How will you control the quality of primary data collected by the (10) field-staff ?

(25)

- 4. (a) Describe the various operations generally involved in the processing of data. (19)
  - (b) How will you control the guility of the tork of processing of data? (6)
- 5. (a) Discuss the various uses of interpenetrating sub-samples. (13)
  - (b) Comment on the following s- (6+6).
    - The concus house list connot be used as a frame for surveys of human population, as a family is sometimes found to have occupied more than one house in the list.
    - ii) The smaller the reference paried, the better is the estimate of the incidence of unemployment.
- 6. Write notes on any three of the following :- (25)
  - a) Role of public relations and propaganda in statistical surveys.
  - b) Schodules and Questionnaires.
  - c) Coding.
  - d) Master-stiplu.
  - e) Report-writing.

#### ocoCoon

### Group F & Techniques of Computation ( Practical )

- i) Time allowed five hours for this practical group. ...
- ii) Answer and four questiones .
- iii) Uso of calculating machines is pormitted.
- 1. A function f(x) and its derivative f(x) are tabulated below : ..

<u>*</u>	_f(x)	f(s)
1.0	0.24197	0.24197
1:2	. 0.19419	0.23302
1.4	0.14973	0.20962
1.6	0.11092	0.17747

Use the full data to evaluate f(1.1) and compare this with the value. that is obtained when the information on f'(x) is ignored. (25)

Please turn over

2. Solve numerically the differential equation

$$\frac{dy}{dx} = x - y^2$$

and tabulate y (correct to five places of decimals) as a function of x, for  $x = 0.0(0.1) \cdot 0.4$ .

It is known that 
$$y = 0$$
 when  $x = 0$  (25)

3. Find to five significant figures all the roots of the equation

$$x^3 - x - 4 = 0$$
 (25)

4. Evaluate

$$I = \int_{1-1+x^2}^{2}$$

using Simpson's one-third rule with

- (a)  $h = \frac{1}{2}$
- (b) h = 1/10
- (c) Show that if  $E_a$  and  $E_b$  are the errors in evaluations I(a) and I(b) as obtained in 4(a) and 4(b) respectively  $E_a \ / \ E_b \ \text{is expected to be nearly equal to }$   $(\frac{1}{8})^4 / (\frac{1}{10})^4$
- (d) Hence show that

$$\frac{E_{a}-E_{b}}{E_{b}} \approx \frac{I(a)-I(b)}{E_{b}} \approx \frac{\left(\frac{1}{8}\right)^{4}-\left(\frac{1}{10}\right)^{4}}{\left(\frac{1}{10}\right)^{4}}$$

(e) Use this result to estimate  $E_{b}$  and correct your evaluation I(b).

(25)

5. For the matrix

a) Obtain a matrix B such that

 For the matrix D in question 5, obtain the latent root with the maximum absolute value and a latent vector corresponding to this root. (25)

# Group G - Statistical Inference

(Answer any four questions)

1,	Describe the Sequential Probability Ratio Test (SPRT) procedure for testing a simple hypothesis against a simple alternative.	(10)
	Obtain a suitable approximation to the Operating Characteristic : function of the SPRT procedure in such a case.	(10)
	What are the good features of the SPRT procedure? Is it, in any sense, better than other sequential test procedures?	(5)
2.	Describe Stein's two sample procedure for obtaining a confidence interval (of fixed confidence coefficient and fixed length) for the mean of a Normal population with unknown variance.	
	Prove that the procedure is valid.	(25)
<b>5</b> .	Explain the term 'statistical tolorance limits'.	(5)
	Calculate the probability that the maximum and the minimum in a sample of n from a continuous population, will cover atleast a proportion x of the population.	(10)
	Calculate the expectation and the variance of the proportion covered by the sample range.	(10)
4	Describe the Wald-Wolfowitz Run test for determining whether two samples are from the same continuous population.	(10)
	What are the good proporties, if any, of this test ?	(5)
	Work out the asymptotic mean of the test statistic, under the assumption that the samples are from the same population.	(10)
3.	Obtain the likelihood ratio test for determining, on the basis of a sample of size n drawn from a multivariate Kormal population, whether specified groups of variates are mutually independent.	
	Write down, without proof, the asymptotic distribution, of a suitable transformation of the likelihood ratio criterion, under the null hypothesis being tested.	(25)

00000000000

# INDIAN STATISTICAL INSTITUTE Statistician's Diploma Examination - May 1964 Paper X - Subjects of Specialisation - III

Time : 5 hours

Full marks :100

- Candidates will be required to answer questions from that group only for which they have registered their options.
- ii) Figures in the margin indicate full marks.
- iii) Use of calculating machines is permitted.

Group A : Economic Statistics

(Attempt any three questions)

1. Given the economy with the following activities:

	^1	ν2	^3	Λ <sub>4</sub>	45	۸6 .	7
Commodity 1	+ 1.0	٠.8	+ 1.0	1	5	8	- ,2
Commodity 2	1	2	7	+ 1.0	+ 1.0	+ 1.0	+ 1.0
Labour	-12.5	- 6	- 5	- 3.3	- 5	- 4	- 10
Capital	- 1.5	- 1.6	3	- 2.0	- 1.5	2	- 1.4

- a) Aneume :
- 1) the availability of 1500 units of labour,
- ii) that each commodity has a value of 1.0.

Determine (algebraically or graphically) the minimum abount of capital needed to produce a net output valued at ICG.

b) What are the returns to capital and labour in part (a)?

 You are given 23 annual observations on production, employment, Capital, and time trend for the U.S. 1929-41, 1946-55. Estimate a macroeconomic production function of the form:

$$Y_{t} = \beta_{1}X_{1t} + \beta_{2}X_{2t} + \beta_{3}X_{3t} + \beta_{4}X_{4t} + \varepsilon_{t}$$

where

Y = real GMP, in billions of dollars

X, - 1

X, = employment, in millions of persons

Xx = real capital, in billions of dollars

X = time in years, measured from 1929 = 1;

this acts as a proxy for smooth productivity trend.

6° - random variable, normally distributed with zero mean, constant variance, independent time-wise, and independent of the X'S The observations are presented in matrix form:

$$x=x_{ti} \quad \text{and} \quad y=(y_t). \quad \text{Thus in 1932, for example,}$$
 
$$x_1=1, \quad x_2=34, \quad x_3=40, \quad x_4=4 \quad \text{and} \quad y=90.$$

	X <sub>1t</sub>	x <sub>2t</sub>	x <sub>3t</sub>	X4t		Yti
x =	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	47 43 39 34 36 38 41 42 37 40 42 47 51 53 50 52 54 55 52	54 59 57 48 36 24 19 22 24 27 36 22 24 27 36 27 59 25 51 62 75 79 108 119 108 119 119 119 119 119 119 119 119 119 11	1 2 3 4 5 6 7 8 9 10 11 12 13 18 19 20 21 22 23 24 25 26 27	. <b>Y -</b>	142 127 118 98 94 102 116 128 140 131 143 157 182 209 214 225 221 243 257 265 276 271

Write out the estimated production relationship with sampling errors in <u>parentheses</u> below the respective coefficients. Indicate how you would test the hypotheses;

- a) that there are constant roturns to scale, and
- b) that the time rate of growth of productivity per amoun is some pre-ameigned value.

[32]

- 3. Assume the following unprecedented model for the economy: Consumption is a linear function of current national Income, Investment is a linear function of current and one period lagged national income, and, by definition, national income equals the sum of investment, consumption, and government expenditures. Government expenditures are exogenous, while the consumption and investment equations are subject to temporally independent errors of behaviour.
  - i) Express the model in symbols.
  - Using the <u>rank</u> (necessary and sufficient) conditions, show that the consumption and investment relations are identified for all values of the structural coefficients.
  - iii) Using the following sample observations for the above model,

estimate the coefficients of the consumption relation by the

leur	consumption	national income	Covernment expenditure
-0	7	10	
1	ð	11	2
2	9	15	3
3	6	9	. 3
4	4	7	2 -

Note: You should use all the predetermined variables in the system while estimating the consumption relation in (41).

# 4. From the data given in the table below: Food Expenditure by Income Class and Family Size

income cinas(න්) .	ningle member	two member	family	four nember family	five or more member family
uncer-1000	349	614	1587	1027	360
1000- 1999	577	730	898	867	1082
2000- 2999	809	944	1077	1240	1300
3000- 3999	82G	1098	1266	1315	: 1560
4cco- 4999	1400	1287	1450	1533	1770
5000- 5909	1276	1511	1602	1668	2007
6000- 7499	1660	1487	1790	1910	2050
7500 and over	2100	2250	2320	2425	2968

estimate the relation >

108 Es = d + play + 2 log N+/1

whome .

E = expenditure on food,

Y - total income,

N - number of person in family,

A = error torm with usual assumption.

Comment on your results.

Group B. Techno-Connercial Statistics -Statistical Quality Control, Operations Research/Elements of Pock-keeping Accountancy, Statistical Methods in Business.

(Uso separate answer books for each of the sub-groups of Group B)

I. Statistical Quality Control

(Auswer any two questions) from this sub-group)

Data were collected for the rejections that can be seen at the knoor-1.a) off stage for castings. The number of bad castings obtained out of 100 inspected for each cast, are noted below.

9	14	7	4	6	. 5	2	1
11	7 4 - 0	4	7	O	6	4	. 4
4	4 -	5	6	7	7	0	
8	8	2	3	13	3	5	

Examine the data with a view to set-up a control chart.

1984 Burgaria

[10]

After the chart was set up. The process was observed to be well imder control for a long period with an average of 4 percent and it was decided to reduce inspection for control. A sample of size 25 was decided upon. Obtain the control limit for the revised chart. At a later date the examination of the control chart gave the following number of defectives, por sample over the last 20 samples.

0, 0, 2, 3, 0, 2, 1, 1, 1, 0, 1, 2, 4, 4, 3,

The quality control-in-charge, decided on the basis of the data that the process has to be checked. Do you agree?

[15]

An experiment has been carried out on an assembly operation to determine the best method by measuring the time to perform the operations. Altogether 5 objects, A, B, C, D and E were assembled by 3 methods X, Y and Z on each of 3 days, Wednesday, Thursday and Friday, giving a total of 45 observations. The actual average times for 10 trials · were !

Make a suitable analysis of the data. Suggest which method of assembly is suitable for which type of object.

[25]

Select n and k' for a known-signa variables sampling inspection 3. plan for one-sided specification so that the O.C. curve of the plan w will be similar to that of the single sampling attributed plan n = 15, c = 2 with this plan what will be the probability of acceptance of a 5 percent defective lot?

## II. Operations Research

(Answer may two questions from this sub-group)

Table below gives the quantity of resources required for unit amount
of each product and the net profit per unit, on each product. The
units are not specified hero.

		avai lable			
resources	potato	corn	beans	Legonice	
Land	1	1	1	120	
Labour	2	3	5	600	
Capital	99	38	20	200G	
Net profit per unit amount of the product	83	72	27		

From the data noted above, find the best allocation of land, labour and capital for a farming enterprise.

[15]

 Solve the following transportation problem, given the following cost matrix, supplies and domaids.

destination	Λ.	В	С	۵	B	supplies
→ c <sub>1</sub>	10	6	14	6	16	6
o <sub>2</sub> .	16	12	24	10	14	8

## II (alterntive) : Elements of Book Keepings and Accountancy

(Answer both the questions from this sub-group)

#### 1. EITHER

G. starts a business on let February 1960. His transactions for the month of February are given below. You are asked to record them in suitable books of accounts and to extract a trial balance as on 29th February 1960.

2nd February: Purchased Furniture for Rs.230 from Calcutta Furnishors; Purchased goods by a Cheque for Rs.420.

3rd February: Withdramn from Bank Rs.20: Purchased goods from A. Tradore Ltd. Rs.250; Sold goods to B. Company Rs.300 less 2 percent discount and paid Calcutta Furnishers Ltd. a Cheque for Rs.100 on a/c.

Bth February: Purchased goods from S.Co., Ltd., Rs.1,175 less 2½ percent discount. Sold goods for cash deposited into Bank Rs.125, Purchased Stationery for cash Rs.15.10.

9th February: Withdram from Bank Rs.50; Paid by cheque A. Anders Ltd., in full settlement of their bill at a cash discount of 5 percent.

10th February: Purchased Machinery and Plant from Bengal Machinery Works Rs.1,500.

15th February: Paid by Choque Bengal Machinery Works in full settlement of their dues; Paid Calcutta Furnishers a cheque for Rs.125 in full settlement of their bill.

16th February: Purchased postage stamp Rs.10 and paid wages to Office Peon Rs.7.00

19th February: Sold goods to C. Ltd. Rs.925 less 2 percent. Sold goods for cash Rs.206 and deposited the same into Bank next borning.

23rd February: Received a Cheque for Rs.200 only on a/c. from B. Company.

25th February: Roceived a cheque from C. Ltd., in settlement of one bill at a cash discount of 5 pergent.

27th February Purchased goods from A. Traders Ltd. Rs.1,52C. 17.

28th February: Returned goods to A. Traders Ltd. Rs.47.60 Purchased stationery for colon Rs.19.60 Paid by a Cheaus, a printing bill for Rs.150.60.

## III: Statistical methods in Business

(Answer any two questions)

 A job was performed by 30 workmen using method I and by 40 workmen i using method II with the following results.

Time (in minutes)	50	51	52	53	54	55	56	57	58	59	60	total
No. of workmen finishing the job by method I	1	3	5	4	7	5	3	1	1	0	0	30
No. of workmen finishing the job by method II	٥	· 1	2	5	8	9	6	3	3	1	2	40

Give 95 percent confidence limits for the exercise saving in time that can be expected from the use of method I instead of method II. [10]

2. A study of the market for various commodities among 8CCO readers of/Collier's Nagratus 'revealed the following distribution of the sample households by size of households a compared with corresponding Census Estimates for all U.S. households. Examine whether the Collier sample provides a representative picture of the size-of-household distribution of all U.S. households.

Table showing relative distributions of 8000 Collier families and all U.S. families by size of households.

persons in household	Collier sample	U.S. families (percent)
1	576	10.0
2	2368	29.8
. 3	1968	24.2
4	1592	18.0
5	80G	10.0
6	376	4.5
7	152	1.7
8 or more	168	1.8
total	8000	100

[10]

 The following table gives data regarding test scarce made by salesmon on an intelligence test and their weekly sales.

enlesmon	test scores	82108	(in hundreds	of rupees
1	40		25	
2	70		60	
3	50		45	
4	60	•	50	
5	. 60		45	
6	50		20	
7	90		55	
ė	40		30	
9	60		45	
10	60		30	

- a) Examine whether the correlation between the test score and value of sales is significant.
- b) Obtain the regression equation of the sales (y) on the test score (x).
- o) Suppose a new enlessin gets a test score 70. Estimate his weekly sales.
- d) What is the standard error of the estimate in (c)? [3+3+1+3]

Please turn ever

#### Group D: Design and Analysis of Experiments

(Answer any three questions from this group)

A varietal trial on a certain crop involving three different varieties was arranged in a Latin Square, After the seedlings had appeared, it was decided to combine one more objective in the same investigation and to dudy simultaneously, the effect of a certain fertiliser (usually applied late) on the crop yield. Accordingly the experimental crop plots where the seedlings had already appeared, were divided into three parts each, and the fertilisers were applied at three lovels (0, 2 and 4 cwt per acro). The assignment of the level to the part was done at random and independently, for each crop plot.

The plan and the yields are given below [the levels are indicated by (0), (1) and (2) respectively].

rovs	columna									
	1	2	3							
1 .	(2) 118	(0) 111	(0) 117							
	(0) 100 V <sub>3</sub>	(1) 130 V <sub>1</sub>	(1) 114 v <sub>2</sub>							
	(1) 105	(2) 157	(2) 161							
2	(1) 168	(1) 124	(c) 61							
	(2) 126 $\nabla_2$	(0) 96 V	(1) 91 $\nabla_1$							
	(0) 70	(2) 121	(2) 97							
3	(1) 90	(C) 8C	(2) 109							
	(2) 100 V <sub>1</sub>	(2) 94 ₹	(0) 63 V <sub>3</sub>							
	(6) 62	(1) 82	(1) 70							

Analyse the data to test for varietal differences. Do these varietal differences depend upon the level at which the fertiliser is applied? Is it possible to make some recommendations regarding the optimum level at which the fertiliser should be applied.

2. An experiment was carried out to compare 9 strains of puddy, which are denoted by (i, j), i = 1,2,3; j = 1,2,3. The design adopted was an incomplete block design, in two replications, each consisting of three blocks with three plots per block. The table below gives the plun and the yield of grain in 1b. per plot.

	Block 1	(3, 2) 11.3	(3, 3) 7.8	(3, 1) 7•5
Replication 1	Block 2	(2, 2) 12.0	(2, 3) 9.3	(2, 1) 8.3
	Block 3	(1, 2) 8.8	(1, 3) 9.6	(1, 1) 6.5
	Block 1	(2, 3) 6.3	(3, 3) 8.5	(1, 3) 8.0
Replication 2	Block 2	(1, 2) 13.8	(3, 2) 14.0	(2, 2) 13.3
	Block 3	(3, 1) 11.3	(1, 1) 8.9	(2, 1) 10.3

#### Group E4 Sample Surveys.

#### (Answer only four questions of which question Mo.1 is compulsory)

1. Study the items of information to be collected in the schedule given for allowy below and prepare suitable scrutiny and tabulation programmes. [25]

# Demographic and Activity Particulars of . Bouschold Members

1.	serial no. of person	1	2	3	4	5	1
3. 4. 5.	relation to head sox (m-1, f-2) age last birth day marital status (code) educational standard (code) whether worked for at loss one day during the last 7 days (yes-1, no -2)						
8.	if yes for (7),  a) hours worked  b) additional hours avai- lable for work						
9.	if no for (7), whether had job or enterprise from which temporarily absent (yes-1, no-2)					i	

<u>codes</u>: marital status: never married-1, married-2, widowed-3, divorced-4, separated-5, educational standard: illiterate-1, literate but below primary-2, primary-3, middle-4, secondary-5, graduate and above in (1), agriculture-1, (ii) engineering-7, (iii) technology-3, (iv) medicine-9, (v) other subjects-0.

2. In a large scale socio-economio survey, a stratified uni-stage design is used where from each stratum a simple random sample of 10 villages is selected with replacement. The following table gives the number of households for each of the sample villages, for all the strata in a region.

stratum er. no.	total no.of		number of households in sample willages							8	
	villa- ges	1	2	3	4	5	6	7 ·	8	9	10
1	6411	43	84	98	0	10	44	٥	124	13	٥
2	4765	50	147	62	87	84	158	170	104	56	160
3	2558	228	262	116	232	139	178	334	٥	63	220
4	14997	17	34	25	34	36	0	25	7	15	31

- i) Estimate the total number of households and its sampling variance unbiasedly. [15]
- ii) Examine whether there has been any gain due to the use of the strata, compared with unstratified simple random sampling with replacement. [10]
- iii) Compare the efficiency of the present allocation with that of the optimum allocation.

For estimating the total cultivated area in a region, a stratified unistage design is adopted, where from each stratum 2 independent subsamples of 6 villages each are selected systematically, with random starts. In the following table are given the totals of geographical area and cultivated area for each of the 2 sub-samples in each of the 10 strata into which the region is divided.

tratun	total	total geo	to	tal of sampl	e village	9
er. no.		of graphical		hical area - miles)	cultivation (in a	erd area
	ge s	sq. miles)	8.8.1	e.e.2	8.8.1	8.6.2
1	2C44	2893	15.40	10.02	3641	2935
2	1304	2114	14.68	6.43	4633	3649
3	1265	2898	9.93	12.93	3050	5043
4	1252	2944	8.80	23.23	3498	4722
5	4264	6998	8.22	8.14	2619	3 6 3 8
6	1598	2755	16.27	22.50	936	3652
7	810	3576	28.CG	18.85	9596	6935
ė	567	3281	46.23	3C.95	9135	10024
9	500	3142	44.09	47.73	9772	12152
10	486	2779	16.C4	15.81	8105	7690
total	14090	33300		-	-	-

- i) Estimate the total cultivated area in the region and its sampling variance unbiasedly. [10]
- ii) Obtain an alternative estimate of the total cultivated area using the ratio method of estimation with the geographical area as the supplementary variate and compare its efficiency with that of the unbiased estimator.
- iii) Estimate (at loast approximately) the bias if any, in the ratio estimator obtained in (ii), and correct the estimate in (ii) for its bias.
- 4. Suppose it is required to estimate the total out-put of a population of 500 factories in a region with a pargin of error of not more than 10 percent on either side of the true value with a confidence level of 95 percent. The coefficient of variation of the distribution of total output is known to be approximately 60 percent.
  - Assuming that the sample mean is approximately normally distributed, calculate the sample size required in case of simple random sampling without replacement.
  - ii) Other things being the same, find out the required sample size of the number of factories in the population is 1000, 2500 or 5000 and comment briefly on the behaviour of the sample size.

    [8]
  - iii) Also find the increase in the sample size, if any, in case simple random sampling with replacement is used instead of simple random sampling without replacement.
- 5. To estimate the total number of persons in a region, a stratified two-stage design is used. In the first stage the villages are selected from each stratum with probability proportional to the previous census population with replacement, and at the second stage households are selected from each sample village in a linear systematic way with a random start. The sampling interval to be used in each village is so specified that the sample design becomes self-weighting with the constant multiplier 48000.

[10]

[5]

The following table gives the number of sample households and the total number of persons in the sample households for each sample village.

stra-			honecholds				households
tuz	willwe	number	nio.of persons	tun	village	number	no.of persons
1	1	8	35	4	1	5	26
	2	7	4G		2	10	30
	3	5	22 '		3	7	28
	4	6	32		4	8	29
2	1	5	16	5	1	1	6
	2	6	28		2	13	54
	3	2	8		3	C	C
	4	9	. 32		4	6	18
3	1	5	19 .	. 6	1	5	27
•	2 .	9	35		2	4	20
	3.	. 7	36		3	5	21
	4	6	32		4	11	47

- i) Estimate the total population within the region and its sampling variance unbia medly.
- Also estimate unbiasedly the total number of households in the regions and its sampling variance [10]

#### Group G + Statistical Inference

(Massur May four questions from this group)

 In a population under random mating the expected proportions of individuals with blood-groups O, A, B and AB are respectively r<sup>2</sup>, p<sup>2</sup>+2pr, q<sup>2</sup>+2qr and 2pq where p, q and r are three 'gene frequencies' which characterises the population (p+q+r = 1).

In a random sample of 400 individuals from a certain population, the blood group frequencies were:

dness pecta	С	Λ	В	ΛB
frequency	163	170	55	12

By approximate formulac, the following estimates were obtained:

$$p = 0.26450$$
,  $q = 0.69315$ ,  $r = 0.64235$ .

Use these as trial values and, by the method of scoring, obtain the maximum likelihood estimates of p, q and r (use only one iteration step). Also obtain the variances of your estimates. [10 + 7]

 The following two samples were obtained from two independent normal distributions N (u<sub>1</sub>, o<sup>2</sup>) and N(u<sub>2</sub>, o<sup>2</sup>):

- a) If  $\sigma^2$  is known to be 850, test the hypothesis  $\mu_1 = \mu_2$  against the possibility of  $\mu_1 > \mu_2$ , a uniformly most powerful test. [6]
- b) Porform the same test as in (a) if o<sup>2</sup> is not known. [7]
- c) Draw the power curve of the test in (a), for the whole range of possible values of μ<sub>1</sub> μ<sub>2</sub>.
   [L]
- 25 students were selected at random from a population one by one and given a test. The scores, in the order in which the students were drawn, are shown below?

It is assumed that the scores come from a normal population whose variance is  $\theta\mathcal{T}_{\bullet}$ 

- a) Upo the sequential probability ratio test for the hypothesis that the mean population score is μ<sub>0</sub> = 40, against an alternative mean value μ<sub>1</sub> = 44, taking α = 0.10 and β = 0.30.
- b) If the whole sample is used for a fixed sample size test of the same null hypothesis, what would be the power of this test?

ſμ

c) It is known that if  $_2$  f(x,  $\mu$ ) denotes the probability density function of N( $\mu$ , o<sup>2</sup>) then, for any specified value  $\mu$ , the unique solution of the equation (for h)

$$\int_{-\infty}^{\infty} \left[ \frac{f(x, \mu_1)}{f(x, \mu_0)} \right]^{h} f(x, \mu) dx = 1$$

$$h = \frac{\mu_1 + \mu_2 - 2\mu}{\mu_1 - \mu_2}.$$

Due this result to draw the CC curve of the test in (a).

[10]

- 4.a) Weights of dry jute fibre (in tolas) were recorded for two samples of jute plants, each sample having been treated by a different chamical process:
  - Sample 1: 0.50, 0.44, 0.10, 0.40, 0.35, 0.15, 0.25, 0.22, 0.24 0.25, 0.44, 0.29, 0.20, 0.13.
  - Sample 2 : G.05, 0.14, 0.63, 0.39, 0.43, 0.45, 0.03, 0.44, 0.28 0.27, 1.00, 0.48, 0.02, 0.42, 0.65, 0.34.

Test if the two samples can be said to have come from the same population by using

- 1) the run test; [5]
  11) Wilcoxon's test [5]
- b) Find the smallest size of sample which should be drawn from an unspecified population so that the probability is 95 percent that at least 90 percent values of the population lie between the minimum and maximum of the sample.
  [5]
- c) The following are 15 pairs of observations on stature (in cms.) and weight (in lbs.):

(146, 83), (159, 92), (130, 30), (146, 74), (145, 62),

(158, 166), (153, 73), (157, ∞), (162, 90), (152, 70),

(162, 95), (152, 70), (130, 91), (149, 10), (159, 76),

(158, 88), (152, 78), (144, 62), (155, 98), (156, 86).

to examine the association between stature and weight.

5. The means of three biometric characters X<sub>1</sub>, X<sub>2</sub> and X<sub>3</sub> and the matrix of pooled variances and covariances are shown below, for two groups of female locusts in two different phases of development.

liean values

	<b>x</b> 1 .	x <sub>2</sub>	x3
phase 1 (n = 20)	25.00	7.81	10.77
phase 2 (n = 72)	28.35	7.41	10.75

Pooled variances and covariances (90 d.f.)

	x <sub>1</sub>	. x <sub>2</sub>	x <sub>3</sub>
x <sub>1</sub>	4.7350	0.5622	1.4685
, X <sub>2</sub>		0.1431	0.2174
. x,			0.5762

- a) Test if the population man values in phase I can be taken to be 25, 7 and 16.
- Test if there is a difference in the corresponding mean values in the two phases.

[16]

c) A new fearle locust is known either to be in phase 1 or in phase 2, and its measurements on the three characters are 26.05, 7.20 and 10.80. In which of the two phases would you place the new locust? [5]

Statistician's Diploma Examination - November 1964

Paper I - Official Statistics and Descriptive Statistics (Theoretical)

Time 4 hours Full marks: 100 a) Figures in the margin indicate full marks. b) Answer throe questions from each group. c) Use of calculating machines is not permitted. GROUP A Describe briefly the organizational set-up of the Mational Sample Survey (N.S.S). (÷) Enumerate the subjects taken up for curvey in the eighteenth round of (b) the M.S.S., indicating their importance in the context of the present national emergency. [4] Discuss briefly the various acposts of the sample design of the (c) eighteenth round of the M.S.S., with emphasis on the sampling frame, interponetrating sub-samples, and self-reighting nature of the design for household enquiries. [8] Give a list of the sectors for which caplogment statistics are currently available in India. Give the names of the publications containing these statistics. [8] Indicate the limitations of the unemployment statistics provided by (b) the Exployment Exchanges, for purposes of trend study? [8] 3. (a) What is the importance of wital statistics? Give the sources of information on Indian with statistics. . [8] (b) Critically examine the scope, coverage and limitations of those statistics and give your suggestions for improving their reliability. [0] 4.(a) What are the sources of statistics relating to motor transport (read)? what are the main heads under which these statistics are available? [10] (v) What are the special publications that arise in the collection of statistics regarding movement of goods by road, in developing countries? [6] , Nonthers. [2] GROUP B 5. Describe with suitable examples, the various types of column and ber charts used in graphical presentation of statistical data. [16] 6.(a) From a sample of a observations, the arithmetic mean and variance are calculated. It is then found that one of the values, x, is wrong, and should be replaced by x . Show that the adjustment to the variance to correct this error is  $\frac{1}{n} \sum (x_1^i - x_1^i)(x_1^i + x_1^i - \frac{x_1^i - x_1^i + 2x_1^i}{x_1^i - x_1^i + 2x_1^i})$ where T is the total of the original results.

Hence or otherwise derive the formula for the variance, when there is

no error but only an additional observation is included.

[0]

6.(b)	Prove the inequality Arithmetic Hean > Geometric Hean > Harmonic mean.	[0]
7•	Define correlation coefficient between two random variables $\mathbf{x}$ and $\mathbf{y}$ , and correlation ratio of $\mathbf{y}$ on $\mathbf{x}$ .	

The variates |x| and |y| have their mean values zero and correlation zero and the same variance  $|\sigma^2|$  . Show that for a given  $|\alpha|$ 

$$u = (x \cos \alpha + y \sin \alpha)$$
 and

have the same variance of and zero correlation.

If the variances of x and y are different and are given by  $\sigma_x^2$  and  $\sigma_y^2$  respectively show that the correlation coefficient between the two variances u and v is given by

$$\frac{\sigma_{x}^{2} - \sigma_{y}^{2}}{\left[\left(\sigma_{x}^{2} - \sigma_{y}^{2}\right)^{2} + 4\sigma_{x}^{2}\sigma_{y}^{2}\cos^{2}2\alpha\right]}$$
[16]

- B.(a) Define the multiple correlation coefficient  $R_{0.12}$  of the variable  $X_0$  on variables  $X_1$  and  $X_2$  and the partial correlation coefficient  $r_{02.1}$  between  $X_0$  and  $X_2$ , eliminating  $X_1$ .
  - (b) Establish the relation

$$(1 - R_{0,12}^2) = (1 - r_{01}^2)(1 - r_{02,1}^2)$$
 [16]

Hentheen. [2]

Paper II : Probability Theory and Statistical Methods (Theoretical)

Zine 4 Hours Full marks -100

- a) Figures in the margin indicate full marks
- b) Answer my three questions from Group A and four from Group B.
- c) Use of calculating machine is not permitted.

#### GROUP A

H letters are randomly placed in I correctly addressed envelopes. ļ. Prove that the probability that exactly k letters are placed in correct envolopes is given by

$$\frac{1}{k!} \sum_{j=0}^{K-k} (-1)^{j} \frac{1}{j!} , \quad k = 0, 1, \quad N.$$

Show that the generating function of the frequency distribution of the . random variable k in given by

$$P(v) = \sum_{r=0}^{N} (v-1)^{r} / r t$$
 [26]

Define conditional and marginal distributions. 2.

A discrete variable X follows the Poisson law 
$$f(x) = \frac{\lambda^x e^{-\lambda}}{x t}, \quad x = 0, 1, 2, \dots$$

\_ If A itself is a random vafiable having the density function

$$g(\lambda) = \frac{1}{|\lambda|} \lambda^{k-1} a^{-\lambda}$$
 where  $C$ ,  $(\lambda) \in \infty$ 

and k > 0; then find the unconditional distribution of X. [16]

- 3. If X, 'a i = 1, 2, ..., n, we someone independent normal random variables N(0, 1), find the distribution of  $\sum X_i^2$ . Prove the additive property of two independent chi-squares and find the mean and variance of chi-square with in degrees of freedom. [16]
- 4. (a) State the Central Limit theorem in any form and indicate its upon.
  - (i)Obtain the normal approximation to the Binomial distribution. [16]
- 5.(n) Find the mean and variance of a Poisson random variable.:

If X and X are two independent Poisson random variables with percentury \( \lambda\_1 \) and \( \lambda\_2 \), then find the conditions on \( \mathreat{n}\_1 \) and \( \mathreat{n}\_2 \) so that an X1 + an X2 is also a Poisson random variable, where an and an are any real numbers.

(P) Find the distribution of the sample mean from a random sample of size two, from a Cauchy population. [15]

	GROUP B - STATISTICAL QUALITY COMPROL	
	(Answer any three questions from this group; for nontiess 2 marks only)	
1.	The specification limits on a measurable characteristic are 100 ± 30 units. The process is such that in the course of production, the process mean is likely to shift, but the process variability remains almost stable. 10 samples of size 5 each, taken at random from the process have given the following values of sample range,	
	9.8, 4.5, 6.7, 11.4, 12.3, 3.6, 8.4, 10.4, 7.6 and 12.9	
	a) estimate the process capability	[4]
	b) find out the interval within which the process zoan can shift, such that the proportion of items outside specification is 2 0.0027.	[5]
	Technical action for regetting the process level is quite expensive Hence the management would prefer to leave the process alone as long as the process mean is such that the proportion of items out of specification does not exceed 0.0027.	277
	o) oxplain how to set up a control chart for X (n = 4) in such a country with the set up a control chart for X (n = 4) in such a	[7]
2.	A process is under statistical control with $\mu=1000$ and $\sigma=40$ with respect to an item measurement. An $\overline{X}$ clear for the item measurement is being maintained with control limits, drawn at	•
	$\mu \pm 30/\sqrt{n}$ where n, the scaple size is	4.
	The Average Run Length (A.R.L) of the control chart is defined to be the average number of sample points to be plotted on the control blant, before a point crosses either of the control limits. Thus for instance, if the very first point plotted violated the limits, the run length is 1 and if the second plotted point violates the limits,	٠٠.
	the run length is 2 etc.	$A^{\gamma}$
a)	Find A. R. L. when u = 1000 and o = 40.	[5]
. <b>b)</b>	Find A.R.L. when u increases by 2 percent of its previous value, while of remains the same (modified value of u-1620; o remains at 40).	[51
c)	Find A.R.L. when $\mu$ remains the same as in (a) but o increase by 10 percent of its previous value in (a).i.o. $\mu$ remains at 1000, and 1100 value of $\sigma = 44$ .	[6]
3.a)	It is desired to determine the 0.0 curve for the sampling plan $n=50$ , $\alpha=1$ and let size $N=600$ . Give the detailed formula and insert all the constants (the numerical answer is not wanted) for determining $\frac{1}{2}$ .	
	i) the exact value of the probability of acceptance, for a lot of quality of p = 0.10	[43
	ii) on approximation to (i) using Binomial	137

iii) an approximation to (i) using Poisson

i) AQL (ii) AOQL (iii) Tightwood inspection.

b) Explain the following turns in respect of acceptance sampling plans

#### GROUP C - STATISTICAL METHODS IN CEMENTS

(Answer any three questions from this group, for neathers 2 marks and

Under simple dominance and linkage, work out the theoretical frequencies
of four phenotypes AB, Ab, aB and ab, in the F<sub>2</sub> generation, assuming
that once character NB is controlled by a diallele system.

Obtain the likelihood equation for estimating the linkage ratio, on the basis of such data. . [16]

- Write a short note on the O-A-B system of classification of human blood and the mode of its inheritance. Describe how blood-typing is useful in
  - blood transfusion
  - ii) cases of doubtful paternity.

[26]

 If a rare malady is a recessive character, controlled genetically by sex linked dialleles under simple dominates, show that the males (heterogametic sex) are at a disadvantage in respect of interitance of the malady.

Giver that under paramixia, the proportion of females having the malady equals the square of the proportion of males having the malady. [16]

Please turn over

4. Consider a breeding programme in which all recessives in each generation are prevented from propagation, and purmittal holds in the residual population. If the character is controlled by a single pair of generator and r denotes the frequency of the recessive gene in the n-th generation, show that

$$r_{n+1} = \frac{r_n}{1 + r_n}$$
 (16)

Renbiess [2]

#### GROUP D - VITAL STATISTICS AND DESCRAPHY

(Answer any three questions from this group, for nontness 2 marks only)

- Explain what is meant by a 'Stable population'. [5]
  Show how the momentary rate of increase of a stable population can be expressed approximately in terms of the average length of a generation and the net reproduction rate. [10]
- 2.a) Describe the principal sources of demographic data in India, and their limitations and relative importance in demographic studies. [6]
  - b) Explain briefly the method used by the consus actuary in India for constructing Indian Life tables, and also thy the method differs from the normal method used, say, in England and Wales.
- 3.a) Define  $m_x$  as a life-table function and show how, in an actual population, an approximate value of  $m_x$  can be obtained by relating the deaths at age x last birth day in a period of n years to n times the mean population at age x, last birth day in that period. [2 + 4]
  - b) Criticise the adoption of the infact mortality rate as an approximation to the rate of mortality in the first year of life  $(q_0)$ . [4]
  - c) What are the implications of the infant mortality rate and what considerations should be borne in mind while making comparisons with this index?
- 4.a) Examine the defects of the 'crude marriage rate' (defined by the ratio of the total number of marriages in a given year to the mean total population of the year) and obtain the correct definition of the 'marriage rate' for the purpose of comparing marriage experiences. [---]
  - b) Explain why,
    - with increasing age, the 'proportion married rises to a peak value and then falls, being affected at the older ages chiefly by mortality.
    - the 'proportion over-married' rises with increasing ago but tends to be constant at older agos, unaffected by mortality.
    - iii) marriage rates are subject to wider secular fluctuations then proportions married.

[5]

Paper VI: Statistical Methods, Design and Analysis of Experiments and Sample Surveys (Practical).

Time + 5 hours.

Pall marks 100

- a) Figures in the margin indicate full marks.
- b) Uso of calculating machines is permitted.

## CRCUP A ..

(Answer all questions)

1.a) . From the data given below, estimate the parameters A and B in the

by fitting a straight line in log X to log Y by the method of least squares.

x	Y	X	Y	`x	Y
16	1.62	60	0.62	110	G-47
20	1.60	70	0.52	126	0.46
30	1.52	80	0.51	130	0.44
40	1.43	90	0.51	140	0.42
50	0.75 .	100	0.49	150	0.40

[10]

A sample of wise 5, from the population with frequency function  $\frac{1}{\pi} = \frac{1}{1 + (x - a)^2}$ ъ)

$$\frac{1}{\pi} \cdot \frac{1}{1 + (x - a)^2}$$

gives the following values 12.16, 12.98, 13.60, 15.62 and 12.45. Find by successive approximation the maximum likelihood estimate of the parameter 'a'. Take 12.2 as trial value and go through two cycles of iteration.

[26]

[5]

Twenty individuals are chosen at random from a population and their 2.3) presents (in lbs.) are found to be

190		122		141	<u> </u>	151	171
132	.1.	128		196		111	96
78		84	٠.	123		142	175
140		162		123		117	140

Do these data agree with the contention that the mean weight of the population is 145 lbs. ? Assume that the weights are normally distributed in the population.

The heights in inches and weights in 16s., of 9 individuals are given b) below. Calculate the correlation coefficient and test if it is significantly different from zero.

hoight	63	6352	67	66 .	68	69.	70	71	70
(in inches)									

woight (in 16s.) 164 165 117 115 119 128 140 142 170 2.e) In a certain experiment on 10 varieties of wheat, 50 plots of the same size are randomly allocated, five plots to each variety, and the following yields in the., per plot are obtained.

Varioties	1	2	3	4	5	6	7	8	9	10
	7	7	14	11	9	6	9	8	12	9
	8	9	13	10	9	7	13	13	11	11
	7	6	16	11	12	5	12	11	11	12
	9	14	17	12	8	4	7	12	11	12
	10	13	14	13	7	8	17	14	11	13

Test if the varieties are significantly different in respect of average yield.

[10]

GROUP B

(Answer any two quantions)

The following table gives the results of an experiment involving 4.
 treatments (indicated by numbers within parentheses) in 4 blocks each of 3 plots, with a blanced layout.

Blocks	Troumoute	and	yields
	(1)	(3)	(2)
1	138	154	96
	(4)	(2)	(1)
2	212	113	120
	(1)	(4)	(3)
3	179	321	234
	(2)	(3)	(4)
4	268	267	312

Carry out an analysis of the intra-block information and write brief report on your findings.

[15]

- 4. A completely randomized design in which whole-plots were split into sub-plots was used to tout 6 varieties of come. Planting was done on 7 different dates. On each date, 2 whole plots each of 6 sub-plots were selected at random and planted. Within each whole plot, the varieties were allocated to the sub-plots at random.
  - a) show the structure of the analysis of variance appropriate for this design, indicating the degrees of freedom for each component. [6]
  - b) given the following mean squares, test for the significance of the main effects of the date of sewing and the varieties and the interaction between the two.

unured of variation	ednure zeuu
,l. dates .	69.74
2. varieties.	54.10
*3. dates > varieties	17.05
4. residual variation between whole plots	37.52
5. residual variation be sub-plots within whole	

To study the effects of glass type (I, II) and phosphor type (A,B,C) on the brightness of a TV tube screen, an experiment was conducted using 3 replications of each of the combinations of glass type and phosphor type. The measured variable was the current in micro-ampress necessary to produce a cortain brightness, the larger tide current, the poorer the tube screen characteristics. The results are given below; analyse the data and comment on the effects of the two factors.

5.

Current in micro-amperes necessary to produce standard brightness.

Cinas typo	Ph	ogy: noige	
' oftens Alo	٨	. B	c.
	280	300	270
1	290	310	285
	285	' 295	290
	230	260	220
II	235	240	225
	240	235	230

[15]

## GECOP C : SAMPLE SURVEYS

(Auswor both the questions)

6. The results of 100 throws of an unbiased coin are given below, where T and H stand respectively for 'tail' and 'head'.

ZHRZ/I	HTHTT	TATHT	THERE
<b>HHJJJ</b>	HTTHT	TTHHU	TTTHH
HHTHT	HTTICH	THETH	CHRIC
HTHTT	SHAVIT	HTTTT	THITTH
TOUR	HTHTT	HRRTT	HTTHT

Using those results, draw a random scaple of 2 units with replacement, from a list of 17 units numbered sorially from 2136 to 2152 inclusive.

Describe fully the procedure adopted by you.

There are 2357 small agricultural farms (area of each loss three 100 acres) in a certain country. A snaple survey of these farms were undertaken to estimate, amongst other things, the average number of eatth per farm. The farms were divided into 5 strata in respect of the area of the farm and from each stratum a specified number of farms were snapled, on a simple readed snapling basis, without replacement. In the table below, we denote by N<sub>4</sub>—the number of

forms in the f-th stratum, the number of forms sampled in the i-th stratum is denoted by  $n_i$ , and  $\tilde{s}_i^2$  and  $s_i^2$  denote respectively the mean and the variance (divisor  $n_i$ ) of the number of cattle in the sample from the i-th stratum; i=1,2,3,4,5.

area of farm (acres)	stratua number (1)	number o in stratum	f farms sampled n <sub>i</sub>	mean number of cattle per sampled form	variance of num- bor of cattle per nampled farm s <sup>2</sup>
lous than 15	. 1	724	61	4.246	27.546
16 - 30	2	648	55	11.636	56.738
31 - 50	3	56G	46	15.957	71.697
51 - 75	4	344	29	23.586	192.326
76 -100	5	81	9	29.667	334.922

a) estimate the average number of eattle per form in the whole country and calculate the standard error of the estimate.

-----

b) cutimate the gain in efficiency due to stratification.

## HIDIAH STACISTICAL THEFITUTE

Statisticion's Diploma Examination - November 1964

Paper VII : Applied Statistics (Practical)

Time : 5 hours.

Full marke + 100

- a) Candidates are required to answer questions from the two groups for which they have registered their option.
- b) Separate answer books are to be used for each of the two groups attempted.
- c) Figures in the margin indicate full marks.
- d) Use of Calculating Madding in permitted.

## GROUP A + ECCHCHIC STATISTICS

(Answer all questions)

 Value of imports (in million dollars) of consumption and capital goods into ECAFE region, are given below for the years 1951-61. Compare the trends in these two types of imports.

. 30 ur	consumption goods	capital 
1951	4031	1378
1952	4185	1501

o/er	200,000	1.8	154.4	2.6	234.5

## CHOUP B + STATISTICAL QUALITY CONTROL (Answer any two questions)

 The following 40 readings represent a pilot run, on the production of a temperature control device. They give the 'on' temperature at which a thermostatically controlled switch operates at a given setting.

Device number	Temperature	Device number	_ Temperature
ı	67.6	21	67.7
2	67.1 .	22	67.4
3	67.6	23	67.3
á	67.5	24	67.6
2 3 4 5	67.3	25	67.5
6	67.5	26	67.1
7	67.4	27	67.7
8	67.5	28	67.9
9	67.6	29	67.2
10	67.6	30	67.5
11	68.0	31	67.7
12	67.7	32	67.2
13	67.5	33	67.8
14	67.6	34	67.8
15	67.6	35 .	67.6
16	67.5	36	67.6
17	67.1	37	67.6
. 18	67.6	38	67.8
19	67.4	. 39	67.7
20	67.6	40	67.9
_			

Check these for control. Make an estimate of 0'. What conclusions, if any, can you reach regarding the prospect that the process can meet specifications of 67.5 ± 0.5? [23]

2. Where doutructive testing is involved, a common acceptance procedure is to tost one article from a lot, passing the lot if the article is satisfactory and taking a second sample of one if the article fails the test. If the second article also fails, the lot is rejected, if the second article proves satisfactory, the lot is accepted. Plot the O.C. curve for this plan, assuming that substitled lot is large enough, so that the selection of a defective article on the first sample does not make my appreciable change in the probability of getting a defective article on the second sample.

Comment on the quality protection given by this plan?

- 3.a) A monufacturer wishes to produce electric fuses with no more than 1 percent defective. He checks quality every so aften by taking a sample of 16 fuses from the line; if one or more of the 10 are defective, the manufacturing process is halted, and a search is made for an assignable cause.
  - i) how aften will be needlessly half production, when defects are running at 0.75 percent?
  - ii) how often will be fail to halt production, when defects are running at 2 percent? [8 + 0]
  - b) A machino produces parts which on an average contain 1 percent defective, when these parts are put in batches without further examination, percentage defective would naturally vary from batch to batch. What should be the size of each batch to ensure that only one batch in a hundred would contain more than 2 percent defectives? [9]

# CROUP C : STATISTICAL METHODS IN CENETICS (Answer all questions)

 Estimate the O - A - B gene frequencies from the observed frequency distribution of O, A, B and AB blood group classes.

plood group	o	٨	В	ÁΒ
frequency	70	45	68	15

Test, whether the expectations are according to Bernstein's theory.. [25]

. The following data relate to 4 back cross tests  $\frac{AB}{ab} \times \frac{ab}{ab}$ .

. .

	Test		٠. :	frequer	ncy		
		•	ΛB	Λb	-aB		ลัง
	i		50	75	160		65
	2		52	80	105		60
	. 3		· 48	70	90		45
	4_		40	63	85	<u>.</u>	40_

Examine whether the four tests provide consistent estimates of the linkage parameter. [25]

## GROUP D \* VITAL STATISTICS AND DESCRAPHY (Answer my two questions)

 The mortality experiences in a given Calendar year of two populations A and B consisting of men aged 70-74, are as follows:

	popu	population A			population B			
Λgο *	numbers emposed to risk at age	denthu at age x	:311	erpoward to boscqxe ogo the tall at age	as ago x	Sı		
70	2,000	64	.G32	3,000	. 81	•C27		
71	1,200	. 42	•035	., 3,500	112 ·	:032		
72	1,400	56	•C40	3,000	117	•C39		
73	1,800	81	¿C45	4,000	184	•C46		
74	1,600	80	•C5C	2,500	140	aC56		
Total	8,CCG	323	•	16,CCO ·	634			

Express the mortality of Population B at ages 70-74 as a single percentage fatio of that of Population A by means of the following:

i) Indirect standardisation

2.

ii) Direct standardisation
iii) Comparative mortality index.

Discuss the differences between the results and the reasons for these differences.

The following table shows the population of England and Wales, enumerated at every census from 1801 to 1911.

Asur.	(in thousands)	year.	census population (in thousands)
1801	8,893	1861	20,066
1810	10,164	1871	22,712
1821	12,000	1881	25,974
1831	13,897	1891	29,003
1941	15,914	1901	32,528
1851	. 17,928 **	1911	36,070

Fit a logistic curve to the Census Populations in the above table, and estimate the maximum expected population of England and Wales. [29]

 The following table may be taken to be characteristic of the Indian population in respect of females:

Ro group	ago-specific marital fortility rate	proportion married	life-table survivoru (
15 - 19	.198	.551	29C4
20 - 24	.268	•830	2792
25 - 29	.237	•947	2647
30 - 34	•120	•9C7 '	2446
35 - 39	.141	.827	2207
40 - 44	.ce7	.736	1958

Calculate the not female reproduction rate, ignoring illegitimate fertility.

(Proportion of female to male births is 100 : 106)

## GROUP E \* EDUCATIONAL AND PSYCHOLOGICAL STATISTICS (Answer all questions)

Subjects were given an attitude test before and after viewing a
notion picture designed to influence their attitudes favourably.
 A high score indicates a favourable attitude and a low score an
unfavourable attitude.

subject	pre-tost	post-tost
1	2.6	2.5
2	4.6	5.7
3	8.9	9.3
4	5.5	6.7
5	5,5 1,9	1.5
6	6.2	7.8
7	4.6	4.7
ė.	5.6	5.9
9	6.9	7.3
10 .	6.6	7.0

Can you conclude that the motion picture resulted in a significant mean change in attitude?

[15]

 The following table gives the matrix of factor leadings of a 6 y 6 correlation matrix, using the 'Centroid process'.

_	<u> </u>	:			_
		I	ıı	III	
`-	1	•542	612	-C74	_
	· 2	. 629	• 34µ	348

#### INDIAN STATISTICAL INSTITUTE

## Statistician's Diploma Examination - November 1964

Paper VIII : Subjects of Specialisation -(I)

Tipo : 4 hours

Full marks : 100

- a) Candidates will be required to answer questions from that group only for which they have registered their options.
  - b) Figures in the margin indicate full marks.

Group A : Economic Statistics - (Econometries)

(Answer any five questions)

Consider the economic system

$$d_{t} = \alpha_{0} + \alpha_{1} p_{t} + u_{t}$$

$$s_{t} = \beta_{0} + \beta_{1} q_{t} + v_{t}$$

$$d_{h} = s_{h} + w_{h}$$

where

d = quantity demanded at time t

.... p = price at time t

a. - quantity supplied at time t .

ut, vt, wt - error terms

 $\alpha_0$ ,  $\alpha_1, \beta_0, \beta_1$  = constant parameters

Are the parameters of this system identifiable? If they are not, what restrictions would you impose in order to obtain identifiability?

(2

2. Milton Friedman's pormanent income hypothesis takes the simple form

$$y = y_p + y_T$$

$$c = c_p + c_T$$

$$c_p = k y_p$$

mpv 22

y = income

c = consumption

P and T are subscripts donoting the permanent and transitory components

k = true marginal propensity to consume. . .

The theory assumes that transitory components are independent of their permanent counterparts and also that transitory consumption is uncorrelated with transitory income. The main objective is to estimate the true marginal proponsity k.

Describe how you would proceed to estimate the marginal propensity given a sample  $(c_1, \gamma_1)$  (1 = 1, 2, ..., N) of household incomes and communities expenditures.

Discuss briefly the nature of the estimate you would obtain and compare it with the ordinary least squares estimate.

(2)

"One of the central problems in economic planning has been the matching of domand and supply, at least of consumer goods. This serves the durl purpose of eliminating speculation by minimising price fluctuation, and of mitigating the undesirable effects of trade cycle. Due to increase in income resulting from planned efforts, the consumer domand is normally expected to rise. For a realistic fixation of output targets, and proper mobilisation of productive forces we need a precise knowledge of increase in consumer demand, emanating from a given increase in por capita income."

Formulate the above problem from an occase tric point of view. State what information you would need in order to estimate the increase in demand.

Show also that a reduction in inequality of income distribution gives rise to a an increase in demand for essential consumer goods and services.

State clearly all your assumptions.

(201

4. Outline some of the major criticisms against the use of Cobb-Douglas production function. Describe how you would use such production functions for estimating the total capital employed in Indian manufacturing industries.

(44.

- 5. Write short notes on the following :
  - i) Durbin-Watson test
  - 11) Fractile Graphical Analysis
  - iii) Multi-collinearity.

(2

 The log-logistic distribution of income (x) is characterised by the equation

$$\log \frac{F(x)}{1-F(x)} = \alpha + \beta x$$

where F(x) is the cumulative distribution function.

Work out the mean and variance for the log-logistic distribution. Show that the Lorenz measure of concentration for this distribution is given by the reciprocal of  $\beta$ .

In what respects does this distribution differ from the log-normal distribution?

(20

 Arrow, Chenery, Minhas and Solow have proposed a new class of production functions devised in the following manner.

Suppose it were an outirical fact that the relation between the wage rate W (stated in terms of the relevant output) and output per man-hour ( $\frac{Q}{2}$ ) is of the form

(1) 
$$W = \Lambda \left(\frac{Q}{L}\right)^{\beta}$$

where A, B are some real constants

Suppose, further, that the underlying production of the economic activity in question is of the form

(2) 
$$Q = L F(\frac{K}{L}, 1),$$

i.e. it is homogeneous of degree one, where (  $\frac{K}{L}$ ) represents capital per man-hour.

In addition it is assumed that the product and labour markets are both computitive so that at factor employment equilibrium

$$\frac{\partial Q}{\partial L} = W$$

There is, of course, the further unstated but implicit assumption, viz. that the observations relating to (1) refer to an equilibrium stuation.

Using the above three relations obtain an explicit form for the production function. Also, work out the marginal productivity of labour and capital as well as the elasticity of substitution between capital and labour.

000000000

## Group B : Techno-correctal Statistics (Statistical Quality Control)

(Answer any four questions)

- 1.(a) Examine the use of 'rational subgroups' and 'control limits' in operating a control chart.
  - (b) When would you recommend the use of 'modified' control limit in an X - R chart? Explain how such limits can be constructed and used in practice.
- (a) Discuss how you would examine the capabilities of a process in respect of a measurable characteristic using variance component analysis.
  - (b) Describe briefly the factors that have to be taken into considerative in suggesting remedial action when process expubility fails to seet specification limits. (13)
- 5. Derive, the sequential probability ratio test for the 'proportion defective' from the point of view of acceptance sampling. Explain how a sequential procedure can be set up for testing the superiority of an experimental method over a standard method when the result of each application of the method is classified either as a success of a failure.

  [25]

Please turn over

(27)

(12)

(15)

4•	Explain the terms ACQL and LTPD in respect of an acceptance sampling plan. When would you advocate the use of an ACQL plan in praference to an LTPD plan? Describe briefly the salient features of any ACQL plan you are familear with.	(25
5.	Write short notes on any three of the following :	
	a) Use of order statistics for estimating lot/process quality.	
	b) Interval estimates of lot quality.	
	c) Control charts for moving averages and ranges.	
	d) Hamilton's standard lot plot method of acceptance sampling by variables.	
	e) Rotatable designo.	(::)
	00000000	
	and the second of the second o	
	Group D : Design & Analysis of Experiments	
	(Answer any four questions)	
1.	Describe the Latin Square layout and the randomisation procedure appropriate for such a layout. Give your critical comments on the advantages and disadvantages of such layout.	., '
	In an experiment involving t treatments, laid out in the form of t X t Latin Square, it was discovered at the stage of analysis of the results, that two of the treatments were identical. What modifications would you make in the analysis?	٠.
2.	Describe a Balanced Incomplete Block design and write down (without proof) the relations connecting the parameters of the design.	;:3)
	If the yield of one plot in such an experiment is missing, how would you analyse the results? Work out the wariance of the estimated difference in the effects of two treatments in such a case.	(15)
,	What is meant by partial confounding in a factorial experiment? Why is this taken recourse to ?	(7 <sup>3</sup>
	Give a balanced schere of partial confounding for a factorial experi- ment involving 3 factors each at 3 levels using blocks of 9 plots each.	(1/4)
	Describe how you would analyse the results of such an experiment.	<i>(``</i> '

	What are the advantages for such a design ?	(10)
	Obtain necessary conditions for rotatability for a design for exploring a response surface of the second degree in two factors.	(15)
5.	An experiment is to be conducted to assess which of two methods of memorizing a poem takes less time: (1) reading a line repeatedly and memorizing it before proceeding to the next line (2) memorizing stanza by stanza (instead of line by line as in method 1).	
	The students in 3 boys' school and 2 girls' schools in the city are available for the experiment. Three pocus, of about the same length written in the same metre, have been selected for the trial. It has been estimated that an average student takes about 30 minutes to memorize a poem of this length. It has been decided to use about 100 students in all, each spending not more than one hour. Particulars of age, family back-ground, porformance in school tests etc for all the students in the 5 schools are available.	
	Give a suitable design for the experiment, explaining briefly how the fundamental techniques of randomisation, replication and error control are utilized in the design. Describe how the results are to be analyzed.	ì.
		(25)
	00000000	
	Group E: Sample Surveys - (Theoretical Aspects)	
	(Answer any four questions)	
1.	Explain the following terms	
	a) Probability sampling	
	b) Area sampling •	
	c) Self-weighting designs	
	d) Stratification	
	e) Double sampling.	(25)
2. i)	Describe Lahiri's method of solection with probabilities proportional to sizes.	,
11)	Show that this method achieves the desired probabilities.	
111)	How is the population mean estimated when sample is selected with probabilities proportional to sizes with replacement ?	
iv)	How would you estimate the variance of the estimator of population mean, for such a design ?	
-1	Describe briefly the advantage of solection with varying probabilities.	(25)

- 3. 1) What are the circumstances under which ratio-estimate of population poan is superior to the simple unbiased estimator?
  - ii) Derive the expression for the bias of ratio-estimator.
  - iii) How would you estimate difference between two ratios ?
  - iv) How would you estimate the variance of the estimator of this difference?
    - v) Describe Midzuno's method of selecting a sample with probability proportional to the sum of sizes.

(25)

- i) Derive the expression for optimum matching for estimating population mean on the second occassion in a repeated survey.
  - ii) Show that a close approximation to optimum matching may be achieved even though the parameters entering the above expression are unknown.
  - iii) Given a sample with partial replacement, how would you estimate the difference between the means on the two occasions? (25)
- 5. i) What are the sources of errors in a survey ?
  - if) What are interpenetrating subsamples ?
  - Describe the use of interponetrating subsamples in the analysis of different sources of errors.

#### 0000000

## Group G : Statistical Inference

(Answer any five questions)

- (a) If t<sub>1</sub> and t<sub>2</sub> are two unbiased minimum variance estimators of a
  parameter 0, show that the coefficient of extralation between them is 1.
  - (b) Prove that P (t<sub>1</sub> / t<sub>2</sub>) = 0, and hence comment on the uniqueness of the unbiased minimum variance estimator.
  - (c) Suppose t is an unbiased estimator of a function g(0) of 0. Find an expression for the minimum possible variance of t. (20)
- 2. (a) Let x<sub>1</sub>, ......, x<sub>n</sub> be a random sample; from a population whose probability density function f(x; 0) depends on a parameter 0. State, without proof, the properties of consistency, asymptotic efficiency and normality of the maximum likelihood estimator of 0. You are required to give accurate datements of the relevant results, and the conditions under which these results hold.

(b) Consider a population characterised by the probability density function

$$f(x; 0) = \frac{1}{||f(0)||} x^{0-1} e^{-x}, (x > 0, 0 > 0).$$

- calculate the lowest bound of variance of unbiased estimators of Q.
- find an unbiased estimator of 9 by the method of moments and verify that it has a variance larger than the value in (1).
- iii) obtain the likelihood equation and examine if the estimator in (ii) is a solution of this equation.

(53)

- 3. (a) State precise definitions of "sufficient statistic" and "complete statistic" for the parameter Q of a probability density function f (x; Q).
  - (b) Given that unbiased estimators toof @ exist, prove that
    - i) if t<sub>0</sub> is a sufficient statistic, it is possible to obtain an unbiased estimator of O as a function of t<sub>0</sub>, whose variance is not greater than the variance: of ti
    - ii) if t is sufficient and complete, there is a unique unbissed estimator with minimum variance.
  - (c) Write a note on how sufficient and complete statistics are useful in the construction of tests of hypotheses.

(2^\

4. Independent random variables  $y_1, \ldots, y_n$  have a common variance  $\sigma^2$  and their expectations are of the form

$$E(y_i) = \sum_{j=1}^{k} \alpha_{ij} \pi_j, \quad i = 1, ..., n,$$

where ai are known constants and m unknown parameters.

- (a) Define an "unbiased linear estimate" of a linear function  $p_1^{\pi_1} * \cdots * p_k^{\pi_k}$  with known coefficients  $p_1, \ldots, p_k$ , and derive necessary and sufficient conditions that such estimates would exist.
- (b) Derive the "normal equations" for the minimum variance unbiased linear estimation of  $p_1\pi_1+\dots+p_k\pi_k$  .
- (c) Assuming that  $y_1,\dots,y_n$  are normally distributed, obtain a test for the hypothesis

(2)

$$H_{G} = \sum_{j=1}^{K} h_{ij} \pi_{j} - G_{i}, \quad i = 1, ..., 2,$$

when it is known that \$\pi\_1,..., \$\pi\_k\$ obey the restrictions

$$R_{C} = \sum_{j=1}^{k} r_{ij} \pi_{j} = Y_{i}, i = 1,..., s.$$

- 5. (a) State and prove the Neyman-Pearson lemma.
  - (b) Use this lemma to show how locally most powerful unbiased tests can be obtained in a single parameter case.
  - (c) Derive a locally most powerful unbiased test for the hypothesis  $a^2 = a_0^2$  regarding a normal population  $\pi(c, a^2)$ . (2.)
- 6. (a) Define "similar regions".
  - (b) Give a set of sufficient conditions on a probability density function with two parameters in order that similar regions may exist for testing a hypothesis regarding one of the parameters. Provide necessary proof.
  - (c) For a normal distribution U(μ, 0²) show how you would construct similar regions for testing the hypothesis μ = μ and then choose a uniformly most powerful test for a specified class of alternatives.
- 7. The distribution of a random variable is known to be one of a finite number of alternatives. Also, on the basis of a random sample of size n, one of a finite number of decisions has to be taken.
  - (a) Define
    - i) loss and risk functions;
    - ii) randomised decision functions.
  - (b) Define 'Bayes', "minimax" and "admissible" decision functions in the above situation and, using the supporting hyperplane theorem for convex sets, show that every admissible decision function is also a Bayes decision function.

# INDIAN STATISTICAL INSTITUTE Statistician's Diploma Examination - November 1964

## Paper IX: Subjects of Specialization -(II)

Time .	4 hours Full marks 100	
	<ul> <li>a) Condidates are required to construct questions from that group only for which they have registered their options.</li> </ul>	
	b) Figures in the margin indicate full marks.	
	GROUP A 1 DECUCATE STATISTICS (Indian Economics & Economics o Planning)	f
	(Answer three questions from each section ) Section I	
1.	'Development of agriculture and development of Industry in India, to a very large extent are not competitive with each other'. Give your considered views on this thesis.	[16]
2.	Discuss the main benefits that India has enjoyed from her membership in I.M.F. and GATT. Gutling the restrictive constraints that operate on the exchange and commercial policies of India in consequence of her membership in these organizations.	[]6
3.	Analyse India's national income by its components. Discuss the difficulties in the way of satisfactory estimation of various components.	
4.	What are the main defects of joint-stock banking in India? How have these been sought to be removed through legislation in the recent past? Can you suggest some further steps for removing specific defects?	[16]
5.	Discuss the main features of the development of steel industry in India, in recent years. Also examine critically the present distribution policy of the government with regard to this industry.	[16]
	Section II	
6.	What in your opinion should be the important features of a long term planning model for India? Give the sketch of an optimization model incorporating such features into it.	[16]
7.	What do we mean by a liatrix of input coefficients? List the main factors which affect the stability of these coefficients. Can you demonstrate the usefulness of an input - output matrix for purposes of measuring sectional interdependence?	. [16]
8.	'India should plan for a structure of production which can ensure a faster rate of growth, but the socialist goal of equalitationism' should be sought through proper tax and public expenditure policies.	
	Comment on this prescription.	[26]
9.	Compare and contrast different models of economic growth in their transment of the quantion of 'input' substitution. Assess the realism on well as the operational significance of the notion of factor substitution in occordic development	[16]

10. Write critical notes on any two of the following:

	<ol> <li>Harginal capital - output ratios and their use in investment allocation.</li> </ol>	
	ii) Import substitution as development strategy.	
	iii) The concept of commodity believes in Ressian Planning.	
	iv) Regional planning in India.	[16]
	Reatness (sections I and II).	[4]

[15]

## Section I (alternative) - Elements of Book-knoing and Accountancy

- (1) Use separate master book for this group.
- (ii) Answer all the questions.

# 1. JUNIOR ACCOUNTANTS' CLUB Accorpts and Paymonts Account for the year ended 51st Documer, 1965

Opening Balance! Rs. Establishamt expenses break tot den0(1 250 (includes Rs.400 for 1264) 6,000 ii) Balanco at Bank 20,550 Subscriptions . Telephone Charges 540 1962 500 Stoap and Stationery 600 20,000 1963 Travelling 150 750 1964 Moeting Expenses 500 1,250 Rent Hall rent 5.400 1,000 Interest on securities Library 3,000 10,000 Donation for Political Donntions agitation 5,000 Telephone receipts 50 Closing Balance: :.. i) Cash in hand . 31G . 11) Balanco at Bank 32,600 Rs. 54,350 Rs. 54.350

The following additional information is available -

- a) The Association holds 3 percent G.P. Notes amounting to Rs. 40,000
- b) The Library Account stood at Rs.20,000 on let January 1963
- c) The donations of Re.1C,CCC are to be funded for a prize to be awarded by the Association.
- d) The outstanding limbilities are:
  - (1) Rent Rs.3CC; (11) Printers bill Rs.15C.

You are required to prepare on Ducone and Expenditure Account for the year ended 31st December, 1963 and a Balance Sheet as at that date. [24]

## 2.FITHER

During an interim audit at 31st December 1960 (final accounts made up to a later date), you are instructed by your principal to reconcile the bank behaves shown in the books of account with the behaves shown in the Brok Paus Book from the following particulars. Prepare a Reconciliation Statement:—Balance per Paus Book 31st December, 1960, overdram Re-1,026-12 n.p. Chaques drawn on 31st December but not cleared till January 1961: fig.12.00 Re.1,021.00, Re.98.20 and Re.112.15.

Benk overdreft interest, 20th December, 1960, not entered in Cash Book Rs.151.61.

Sum received on 30th December, 1960, but not lodged in bank till 3rd January 1961 Fa.20,100.00.

Cheque book Ra.5.CC, 10th November 1960 entered in the Chain book twice in error and another Cheque Book debited in Bank Pass Book in August, 1960. Re.1.CC not entered in the Chain Book.

Bill Receivable due on 29th December, 1960, was passed to the Runk for collection on 28th December, 1960 and was entered in the Cash Book forthwith. Whereas the proceeds were not credited in the Bank Pass Book till 1st January 1961, Ru.25C.CC.

Bill straps amounting to Re 1.80 had been debited in the Pass Book no entries having been made in the Cash Book.

Chamber of Commerce subscription paid by bankers order on lat December 1960 had not been entered in the Cash Book Rs. 46.00.

Note: Assume that you do not after the Cash Book Balance at 31st
December 1960, all correcting entries being made in January 1961. [24]

## 2. CR

A trader's Book-Keeper has agreed a Trial Balance and drafted the Trading and Profit and Loss Account and the Balance Sheet. You discover the following errors:

- Sales on Approval amounting to Rs.100 have been included in the Sales Account, Rs.75 of these goods were returned. He record of the return was made in the books, but the returned goods were included in Stock at their cost price of Rs.50.
- A Cheque for Rs.250 received for a loss of stock sustained by fire has been paid by the proprietor into his private Bank No and not recorded in the books.
- iii) Purchased goods amounting to Pm.200 are included in Stock but the invoice was dated forward and is not entered for the period under review.
- 17) There were three componenting errors, wiz., Discounts received were underense Rs.5.CC + Dobit side of a Sales Lodger Account was overcast Rs.10.CC and a payment of Rs.15.CC for Legal Expenses had not been posted from the Cash Book.

State the effect of each of these errors, and summarise the alternations to be made in the Accounts as originally drafted. (24)

3.EITHER

The Gross Profit of a training concern has come down from 15 percent to 10 percent in an accounting year. How would yet justify the short fall of Gross Profit in comparison with the previous period?

[10]

<u>CP</u>

There is a Consumers' Stores in your locality. Prescribe suitable books with rulings which will be sufficient to keep the details of its business transactions.

[10]

4. EITHER

Now human errors can be eliminated in recording books of accounts?
What are the common types of errors which you may come across
in electing up the final trial balance of a business pomern?

[20]

CP.

+rite .uhort notes on 1-

- a) Deferred Revenue Expenditure
- b) Watered capital

c) Current Ausets.

[10]

Heatness

~ [2]

(න<sup>ා</sup>

## GROUP D. DESIGN AND ANALYSIS OF EXPERIMENTS

(Answer my four questions)

Construct a group divisible design based on a balanced incomplete block design with  $\lambda = 1$ .

- Explain the method of difference sets in the construction of a balanced incomplete block design and construct one of the following designs
  - i) v = b = 13, r = k = 4,  $\lambda = 1$

ii) 
$$v = b = 19$$
,  $r = k = 9$ ,  $\lambda = 4$ . [25]

- 3.a) Define a finite projective plane and show how it can be constructed with the help of a finite field.
  - b) Define a Hadamard matrix and show how to obtain another Hadamard matrix with the help of two given Hadamard matrices. [25]
- 4. Defind 'balance' in symmetrical factorial experiments. Show that complete balance can be achieved over the 2, 3, ..., a factor interactions in a (u<sup>m</sup>, u<sup>m-1</sup>) design (i.e. for a design in which the complete replication consists of u<sup>m-1</sup> blocks of u onch) in (u-1)<sup>m-1</sup> replications and where the main effects are unconfounded. [25]
- 5. Show that if the alian sub-group involves only interactions of the (t + k 1)th and higher orders (t > k), the alians of an interaction of order (k-1) would be an interaction of order (t-1) or more [25]
- 6. Define a rotatable design and explain its uses.

Give a method of constructing rotatable design of second order in three dimensions.

## GROUP E. SAUPLE SURVING - CHOMMIZATIONAL ASPECTS

(Answer one four guestions)

1.	Describe the various operations involved in the collection of data through sample surveys.	5)
2.1)	Explain the basic principles that should be observed at the time of processing of data.	<u>`</u> ز
ъ)	Describe in short the functions of the principal punch-card equipments. $f_{\Sigma}$	رد
3.	You are noted to conduct an occupate survey of small industrial catablishments of your state.	
	n) describe the various phases of the work subsequent to the planning stage of the survey,	
	b) how will you control numerical accuracy in analysing the data? [2	.11
4.	You are required to conduct a family budget enquiry in your state for determining the weights for construction of cost of living indices of the non-agricultural class of population.	
	a) draw up the necessary sciedules for the survey,	5
	b) draft the instructions for the field workers explaining the concepts and definitions of the major items of the schedules,	r',
	e); the up the blank tables in which the data will be presented,	5]
	<ul> <li>d) prepare the necessary punch-eard designs for mechanising the analysis work,</li> </ul>	۔ ز <b>ز</b>
5.8)	Discuss the merits and demerits of the methods of mail-enquiry and interview.	<b>/</b> 1
b)	You are naked to conduct a sample survey for estimating the number of vagrants of different entegories in a big city of India. Aint will be your frame? Discuss the possible sources of non-sampling errors that may affect the results of the survey. Not will you minimise these errors?	23
c)	Trite a critical note on the types of non-ampling errors that my arise when decisions on sample design are based on sample results.	7;
6.	Write notes on any three of the following.	÷.
	n) follow up of non-response cauca	
	b) optimum design

#### GROUP G. STATISTICAL INVERSAGE

## (Answer my four questions)

1.	Derive the toquential Probability Ratio Tout procedure for testing the hypothesis that the mean of a Hermal population is unagainst
	the alternative that the mean is $\mu_{a}$ , when the standard downstion of
	the population is known to be unity. Work out the Average Scaple Number required by the procedure if the test is to be of strongth
	(α, β). (25)

- 2. Write a note on Hoeffding's U-statistics and its limiting distribution. Express the sample variance as a U-statistic and hance derive its limiting distribution (after normalisation) as the sample size tends to infinity.
- 3. Lot y and z be respectively the r-th and the s-th r / s order statistics in a sample of size in from a population with cumulative distribution function F(x) which has a continuous density. Let 6 be defined by F(6) = p where O < p < 1. Work out the probability that y / 6 / 2, and show how this result could be used in setting up a confidence interval for G. Discuss in particular the case r = 1, s = n,  $p = \frac{1}{4}$ . (25)
- Write short notes on the following non-parametric test procedures. 4.
  - i) wilcoxon's tost for two samples

  - ii) Sign test
    iii) Kendall's Rank correlation test for independence. (25)
- How will you test, on the basis of samples from two p-variate Normal · populations known to have a common dispersion matrix, the hypothesis that the two mean vectors are equal when the common dispersion entrix is (i) known and (ii) unknown and is to be estimated. ... In each case work out the sampling distribution of the test statistic when the hypothesis is true.
- 6. Derive the likelihood ratio test for the hypothesis that two multivariate Horsal populations have a common dispersion amtrix. (25) Can you suggest any other suitable test procedure ?

------

# IMMIAN STATISTICAL INSTITUTE Statistician's Diploma Examination - November 1964 Paper X - Subjects of Specialisation - (III)

Time : 5 hours .... Full marks :100

- Candidates are required to numer questions from that group only for which they have registered their options.
- ii) Figures in the margin indicate full marker
- iii) Use of calculating machine is permitted.

A notorious model of the most market is:

Dearnd: 
$$\beta_{11} Y_1 + \beta_{12} Y_2 + Y_{11} Z_1$$
 ... =  $\mu_1$ 

Supply • 
$$\beta_{21} Y_1 + \beta_{22} Y_2$$
 +  $Y_{22} Z_2 + Y_{23} Z_3 = \mu_2$ 

The variables are

Y, and consumption per capita (pounds)

Yo retail price of meat

Z' i per capita disposable income (tens of \$)

Z; . unit cost of processing mont (index)

Zx : cost of agricultural production (index)

(All variables are expressed as deviations from means.)

. The sample-consists of 23 amount observations. The master moment

matrix  $\mathbf{H}_{XX} = \begin{bmatrix} \mathbf{x}_{i} \\ \mathbf{x}_{j} \end{bmatrix} = \begin{bmatrix} \frac{1}{2} & \sum_{t=1}^{2} \mathbf{x}_{i,t} \\ \mathbf{x}_{j,t} \end{bmatrix}$  has been computed:

Yı		. Y <sub>2</sub>	<sup>2</sup> 1	22	. Z <sub>3</sub> .
Y <sub>1</sub> 50.54	5	-15.328	15.965	-23.325	42.777
Y <sub>2</sub>		68.760	36.324	36.971 -	53.729
$z_1$			34.276	15.703	53.064
z <sub>2</sub>			•	110.209	31.773
<sup>2</sup> 3					114.217

#### Chtain

- mechanical locat square estimates for the demand equation, assuming Y<sub>1</sub> as the dependent and Y<sub>2</sub> and Z<sub>1</sub> as explanatory variables, and
- b) limited information maximum likelihood estimates for the supply equation. Estimate sampling errors.

 The following table gives the frequency distribution of income in the United Status [1954].

income (	\$ 000)		percentage of fam	ilios
less thm	1		6.1	- 7
1 -	2.		10.6	
2 -	3	• :	12.3	
3 -	. 4		14.4	
4 -	5	٠.	14.8	
5 -	6		12.6	
6 -	7₺		12.3	
7ž -	10 '		9.6	
10	15		4.3	
more than	15		3.0	

Fit a Pareto distribution to the above data. Estimate the parameters. One this information to derive the concentration coefficient and the mean level of income.  $\frac{1}{2}$ 

[32]

3. Given an econogy with the following possible production notivities:

	۸1	ν2	۸,	۸4	۸5	۸6
Connodity 1	+ .8	+ 1.0	÷ 1.0	5	8	2
Composit ಕ್ಯ 2	-, .2	1	7	+ 1.0	+ 1.0	+ 1.0
Labour		-12.5		- 5	- 4	10
Capital	-1.6	- 1.5,.	3`	- 1.5	2	- 1.4

- .a) determine the most efficient combination of activities for producting any combination of the two commedities of labour is the only limiting factor and only 750 units of labour are available.
  - b) determine the rolative prices of the two commodities and of the capital in part (a).

·Note \* (+) signs indicate outputs and and (-) signs indicate inputs. [32]

4. · Consider the model:

$$Y_1 = \alpha + \sqrt{\beta}$$
  $X_1 + \mu_1$ 

where X is non-stochautio

and  $\mu_i$  independently and identically distributed with mean zero, over a set of 12 observations.

The sums of equares and cross-products (around the respective means are:

	Y	X	
 Y	250	150	
X		. 100	

Derive and compute an unbiased estimate of β. [32]

## GROUP B. TECHNIC-COMMERCIAL STATISTICS -STATISTICAL QUALITY CONTROL, OPERATICI'S RESEARCH/ELLEWIS OF BOOK-KEEPING & ACCOUNTAINTY, STATISTICAL METHODS IN BUSINESS.

(Separate enswer books are to be used for each of the sub-groups of B)

#### I. Statistical Quality Control

(Answer any two questions from this sub-group)

 Determine the equations of the rejection and acceptance lines for an item-by-item sequential sampling inspection plan, in which

> AQL = 0.05 Producer's risk = 0.10 L.T.P.D = 0.15 Consumer's risk = 0.20

Prepare on item-by-item table of acceptance and rejection numbers for values of n from 1 to 50.

Plot an approximate G.C curve for the above plan. [9]

[16]

In an investigation of the eccentricity of helical gear, the measurements were taken on a few randomly chosen products at three main operations around twining, milling and grinding. The data are given below.

Turning	Eilling	Crinding
C.CC20	0.0080	G.C110
0.0005	0.6636	G.G10C
0.0025	G.CC40	0.0050
0.0050	0.6650	0.0100
0.0020	0.6120	O.CG40
0.0015	C.C1CC	0.0090
0.0050	0.0060	0.0040
0.0020	C.CC45	0.0040
0.0020	C.CC70	0.6126
0.0010	0.0070	C.C050

- can the variations in the occentricity at the turning and the milling operations be considered different?
- ii) is there any ovidence that the variations at the milling and grinding operations are different? - [25]

3. In Aluminium rolling, ingots were east with two different heading motal temperature, high rad low. There were 30 ingots east at the high temperature and 20 ingots east at the low temperature. After cauting, ingots were hot rolled and cut into two halves. The heading half of each ingot was again cheared into 7 pieces. A count was made of the pieces rejected due to blisters. The results are shown in the table below.

	Rejected	Good	Total
High temperature	39	171	210
Low temperature	46	166	140
Total	79	271	350

Is there my ovidence that temperature has an effect on the occurrence of blisters? (25)

# II - Creations Research ( Answer both the questions)

1.n) :Using simplex method, find the non-negative values of  $x_1$ ,  $x_2$ ,  $x_3$  that will maximize the expression

$$x z = 3x_1 + 5x_2 + 4x_3$$
.

subject to the restriction

From the optimal simplex tableau obtained in (a), write down the
optimal values of the dual variables, and verify the 'duality property'
that the optimal values of the original and the dual problems are the
same.

2. EITHER
A national car-resulal service has a surplus of one car in each of the cities 1, 2, 3, 4, 5, 6 and a deficit of one car in each of the cities 7, 8, 9, 16, 11, 12. The distances between cities with a surplus and cities with a deficit, are displayed in the matrix below.

cities 7, 8, 9, 10, 11, 12. The distances between cities with a surplus and cities with a deficit, are displayed in the matrix bolow. How should the cars be dispatched so as to minimize the total mileage travelled?

## III . Statistical methods in Business

(Answer both the questions)

The books of a firm show the inventory to be valued at Re.1,27,461.
 There are 1000 inventory items. To confirm the remonableness of the rupes value of the inventory, a random sample of 12 items was selected and the values of the items checked and corrected if necessary. The following table gives the book values and the middled (correct) values of the items in the sample.

1:02			ue	. nudited value :
No.		in rupces	(x)	in rupees (Y)
		·		
1		117		117
2	211	96		96
3		213		213
4		200	5 T 25 2 1	247
.5		260		260
6	- "	93		73 :-
. 7	٠.	. 198		165
8		81		81 '
9		83		- 75
10		327	•	327
11		110		110
12		87		77

- using the ratio method of estimation, get an estimate for the total value of the inventory,
- b) a find the standard error of your estimate. [5+5]

## 2. ETTHER · ...

The following data whow weekly production in units for ten exployees before change  $(X_1)$  and after change  $(X_2)$  in the production technique.

•		·	:		.12	
		weekly production				•
_	ezployee	before clango (X <sub>1</sub> )	af	(X <sub>2</sub> )	neo	
	A.	24		26 26		•

	Ē .	F 525 to 123 to 1541, 5551 a		:. 24		,
	· C	30 32	٠.	32	· · · !	
<i>-</i>	I. H	25 23	*.2 - 4.	26 24		
	· J	23		. 25		

Nest whother there is any significant change in average production due to the charges in the production technique.

2. CR

The table below gives individual tardiness rates (calculated as the number of times tardy per hundred starts) for 310 employees of a banking organisation.

		tard	inege rate	20	
ngo group	0 - 4	4 - 8	8 - 12	12 - 16	16 - 20
20 - 30	16	14	18	22	. 9
3C - 4G	19	25	33	26	11
40 - 50	21	16	24	42	20

Test whether the tardiness rate is independent of the age group.

[10]

## GROUP D. DESIGN AND ANALYSIS OF EXPERDMENTS (Answer cony. Shroe quostions)

You are given below the data from a 2<sup>3</sup> factorial experiment on soynbonus, in two 4x 4 quasi - Latin squares. The factors are limestone (A), phosphorus (B) and pokula (C) and in each case the lower level implies 'no application'.

	Square I				Square II					
c	(1)	ისი	ab		a	ຄຽວ	ъ			
58	62 ;	60	59	62	65	69	63			
a	ac	υ.	bc	(1)	ac	· be	ลb			
66	61	,60	. 3	62	63	59	69			
abo	be	(1)	a	abe	ъ	(1)	· ne			
64	61	63	59	. 66	57	64 .	67			
υ.	ຸດນຸ	ac	0	ab	bo	a	c			
58	62	67	67	. 66	53	58 .	58			

- a) identify the effects that are confounded with the ross and columns of the squares,
   [4]
- estimate the main effects and the interactions and obtain the expressions for the variances for your estimates,
- c) test the individual main effects and interactions and write a small report on your findings.

In an experiment to compare four treatments A, B, C, D four tyres
were built up each in three parts using three, of the treatments,
one for each part. The compositions of tyres together with relative
were values obtained after a suitable length of run, are given below.

Treatments		2/10	9	
110.1.12011.20	1	2	3	4.
٨	238	196	254	-
	239	214	-	312
В	279	-	330	.419
C	-17	3C8	365	411

- a) analyse the data using within tyres comparisons only. [16]
- b) obtain an estimate of between tyres variation giving your comments, if any,
- c) it was found later that the measure of relative wear on the part of tyre 2 built by using treatment A was obtained by a different procedure and it was considered desirable to ignore it. Examine the hypothesis of equality of treatment effects. [6]

Honderson conducted an experiment in retail grocery stores to determine the effect on Helitesh apple sales (in pounds) due to packaging the apples in 4-pound (treatment A), 6 pound (treatment B) and 8-pound (treatment C) solythone bags. Six grocery stores in central New York were used. Bags of particular types were put on sale in different stores in the three periods as indicated in the table below.

	Department Stores						
Poriod	1	2.	3	_ 4 .	. 5	6.	for reriots
first week	72(A)	1C2(B)	64(c)	164(A)	2C8(B)	96(c)	706
second week	90(B)	82(C)	72(A)	156(C)	156(A)	112(B)	668
third wock	72(C)	92(A)	BC(B)	2C9(B)	178(C)	- 9C(N)	721
Total for	234	276	216	529	542	. 298 .	2695

	Treat	⊐en t	Treatment	total
:	٨		646	
	. B		801 648	

sum of squares of the observations = 283797 sum of squares of period totals = 1464501 sum of squares of store totals = 839997

The letter in any cell (period X store) indicates the type of bags put on sale and the figures, the actual total sale in pounds during the week. It is assumed that the type of bags used in one week any have some effect on the sales during that week and the next but not thereafter.

Analyse the data and test for treatment differences (test separately for direct and residual effects). You may use the computations supplied.

Give a second order rotatable design involving three quantitative factors. Write down the analysis of variance table giving algebraic expressions for the sum of squares due to the first and the second order terms. Obtain an expression for the variance of the estimated response at specified levels of the factors.

[12 + 12 + 0.] /4 1

[32]

Moatnoss

## GROUP E : SAMPLE SURVEYS (Practical)

## (Answer four questions, of which no. 1 is compulsory)

d. Study the information to be collected in the schedule given below and prepare suitable scrutiny and tabulation programmes.

[25]

[1C]

[13]

## Fertility history of coupled ".

	15	16	432		15	8	416		15	4	74
_	16	10	498		16-	8	326		16	4	6

(x-length of strip, y - volume of timber)

- examine the behaviour of the sampling variance of estimates of volume of timber based on systematic samples for different sample sizes (n = 2, 3, 4, 6, 8, 12).
- ii) compare the efficioncy of systematic sampling with those of simple random sampling with and without replacement, for the sample sizes considered in (1), [8]

[12]

iii) also study the officioncy of sampling the strips with probability proportional to the length of the strips with replacement. [5]

Suppose it is required to estimate the rate of incidence of a particular disease in a region having a population of 2500 persons within 5 percent of the true value in the sense that if the sample estimate is k percent, the population proportion is to lie between (k-5) percent and (k+5) percent, with 95 percent confiduce.

- determine the sample size required in case of simple random sampling with replacement, assuming that the sample proportion is normally distributed and that the proportion is likely to be about 60 percent,
- ii) suppose the region is divided into two sub-regions having a population of 1000 and 1500 such that the proportions of persons having the specified disease in the two sub-regions are likely to be about 30 percent and 70 percent respectively. Determine the total scape size required for estimating the over-all population proportion with the specified margin of error, if the scapling is done separately from the 2 sub-regions.
- 5. To study the living conditions of the working class population residing in an industrial region, a stratified two-stage design is proposed where the factories are to be selected with probability proportional to the number of workers obtained in an earlier period with replacement in the first stage and at the second stage a sample foreign is to be selected linear systematically from each sample factory using the current list of workers. The following table gives the number of workers used in the selection of factories and the current number of workers for each of the sample factories.

stra-	total	tal sample factory				total

\* frame for selecting factories.

- i) determine the constant multiplier for the region as a whole that is to be used in making the sample decign self-weighting, no as to ensure a total sample size of about 200 workers; [12]
  - ii) specify the sampling intervals to be used in each sample factor; so as to make the design self-weighting with the constant multiplier determined in (1); [8]
- also find approximately the number of workers that would be selected from each snaple factory thereby determining the total snaple size actually achieved.

# GROUP G: STATISTICAL IMPERIOE (PRACTICAL) (Auser my four questions)

1.a) To test the effect of the presence of coal in the sand used for making concrete, 5 different proportions of coal were decided upon, and 4 concrete cylinders were made, containing each of these proportions of coal. The following table shows the breaking strength of these cylinders.

( . .

	percentage of co					
· · · · · · · · · · · · · · · · · · ·	C	0,05	0.1	0.5	1.0	
Broaking strongth	169	155	162	172	153	
in 10 1b./sq.inch	158	144	145	155	154	
. * -	174	164	151	143	156	
	168	154	160	144	152	

Test whether variability in breaking strength differs significantly with varying proportion of coal present in concrete.

[5]

1.b) The following table shows scores in two tests of 15 candidates.

Candidate	1	2 '	3	-4	5	. 6	· · 7	8	, 3	16	11	12	13	14	15
Score in test 1(X)	15	18	8	16	54	95	22.	69	75	8	53	26	21	9	18
Score in															٠,••
test 2(Y)	29	16	18	- 20	20	34	10	31	39	32	35	14	27	10	11

Assuming that the scores X and Y come from a hivariate normal distribution, test whether their variances are equal.

[25]

(25)

2.a) Three sets of observations from bivariate normal distribution yielded the following coefficients of corrolation.

•			
1	35	C.62	
2	40	0.45	
3 .	· 25	0.70	
	3		

Tost whether the samples cano from populations with the same coefficients of correlation.

- In the above example, a hypothesis is ande that the population from which the first sample was drawn has a coefficient of corrolation 0.50.
  - . 1) tost this hypothesis
  - ii) draw the power curve of your test by calculating its power for the values 0.10, 0.25, 0.40, 0.50, 0.60, 0.75, 0.90 of the coefficient of correlation.

3.a) Variables X and Y denote age in years and clest expansion in inches respectively. Two groups of children were observed and the following computations and at the computations are computations.

group	size of	20:	υ1 ·	ಕಣವಾಗಿ ot		and products
no.	group	. <b>х</b>	Y	SXX	S <sub>YY</sub>	Syy
1	12	13.481	1.560	3.416	0.234	8.623
2	16	13.573	3.002	3.759	0.263	15.652

Examine if the linear regression of Y on X in the two groups are (i) identical, (ii) parallel.

b) Each of 10 pots were measured twice for volume by four investigators A, B, C, D, thus yielding 80 volume measurements. The total sum of squares (uncorrected) of these values is 100269. The following table shows the sum of the tre measurements taken on each pot.

pots	1	nvceti	gator:	y	_	Potu	invoutigators			
		В	C_	D			A	В	С	D
1 .	. 78	61	69	-90		6	14	35	22	26
2	82	.82	75	85		7	102	. 102	96.	161
3	78	66	76	96		8	: 60 '	81	72	58
4	24	36	41	39		9	36	59	· '56	47
5	44	50	49	37		10	90	109	94	97

The sum of squares (uncorrected) of these pair-sums is 198359.

Make out an minigate of Variance table showing variation due to pote, investigators, internation between pats and investigators and error, and write your comments. (25)

- a) In the following table
  - col. 1 shows upper limits of class-intervals of an observed distribution,
    - col. 2 the observed class frequencies and .
    - col. 3 expected class frequencies obtained from an assumed normal distribution.

upper class. limits		expected class frequencies	<b>6]</b> 288	observed class frequencies	expected claus frequencies
(1)	. (2)	(3)	(1)	(2)	(3)
20.5	2	c.6	32.5	102	113.7
22.5	. 7 .	3.9	34.5	67	76.2
24.5	15	16.4	36.5	36	29.3
26.5	49	47.6	38.5	5	8.4
28.5	82	93.2	40.5	1	1.8
30.5	138	125.9			
		-, ·	Total	511	511.C

Calculate the Kolmogorov statistic  $(D_{ij})$  to test whether the assumed normal distribution gives a good fit and expine its significance with the help of the following table which gives for large values of sample size N, pairs of numbers  $\lambda$  and  $\alpha$  which satisfy the relation  $P\left\{|D_{ij}>\lambda\right\}|_{L}\alpha$ .

$$\alpha$$
 : 0.20 0.10 0.05 0.01  $\lambda$  : 1.07  $n^{-\frac{1}{2}}$  1.22  $n^{-\frac{1}{2}}$  1.36  $n^{-\frac{1}{2}}$  1.63  $n^{-\frac{1}{2}}$ 

b) The observed values of X<sub>1</sub> and X<sub>2</sub> from two paired samples is given below. No assumptions can be made regarding the form of the distributions of X<sub>1</sub> and X<sub>2</sub>.

x <sub>1</sub>	. 15	19	31	- 36	16	. 11	19	15	10	16	
X <sub>2</sub>	19	30	26	8	16	6	17	13	22	8	

Is it reasonable to assume that the medians of the populations from which the values of  $X_1$  and  $X_2$  arose are equal? (2)

5. In a certain experiment 18 rabbits each received a high dose of insulin and 18 other rabbits each a low dose. The blood sugar was measured at 1, 2 and 3 hours after each dose and those readings are denoted by X<sub>1</sub>. X<sub>2</sub> and X<sub>5</sub>. The difference of the means of X<sub>4</sub> in the two samples is denoted by d<sub>4</sub> (i = 1,2,3). The following table shows the values of d<sub>4</sub> and the pooled within sums of squares and products.

	41	d <sub>2</sub>	d.3
	7.594	19-73	25.04
	x <sub>1</sub>	X <sub>2</sub>	х <sub>3</sub>
x <sub>1</sub>	2677	1278	1814
X <sub>2</sub>		2358	1966
x <sub>3</sub>			3223

- Find the coefficients of X<sub>1</sub>, X<sub>2</sub> and X<sub>3</sub> in the linear function which would best discriminate between the two underlying populations.
- b) Colculate the D<sup>2</sup> distance between the two populations and test its significance. (25)
